5.29.1 Detailed Description	89
5.30 User Program	90
5.30.1 Detailed Description	90
5.31 Bootloader	91
5.31.1 Detailed Description	91
5.32 Demo for Nucleo-F091RC/Keil	92
5.32.1 Detailed Description	92
5.33 User Program	93
5.33.1 Detailed Description	93
5.34 Bootloader	94
5.34.1 Detailed Description	94
5.35 Demo for Nucleo-G071RB/STM32CubeIDE	95
5.35.1 Detailed Description	95
5.36 User Program	96
5.36.1 Detailed Description	96
5.37 Bootloader	97
5.37.1 Detailed Description	97

5.38 Demo for Nucleo-G071RB/GCC	98
5.38.1 Detailed Description	98
5.39 User Program	99
5.39.1 Detailed Description	99
5.40 Bootloader	100
5.40.1 Detailed Description	100
5.41 Demo for Nucleo-G071RB/IAR	101
5.41.1 Detailed Description	101
5.42 User Program	102
5.42.1 Detailed Description	102
5.43 Bootloader	103
5.43.1 Detailed Description	103
5.44 Demo for Nucleo-G071RB/Keil	104
5.44.1 Detailed Description	104
5.45 User Program	105
5.45.1 Detailed Description	105
5.46 Bootloader	106
5.46.1 Detailed Description	106
5.47 Demo for XMC1400 Boot Kit/GCC	107
5.47.1 Detailed Description	107
5.48 User Program	108
5.48.1 Detailed Description	108
5.49 Bootloader	109
5.49.1 Detailed Description	109
5.50 Demo for XMC1400 Boot Kit/IAR	110
5.50.1 Detailed Description	110
5.51 User Program	111
5.51.1 Detailed Description	111
5.52 Bootloader	112
5.52.1 Detailed Description	112

5.53 Demo for Nucleo-L552ZE/STM32CubeIDE	113
5.53.1 Detailed Description	113
5.54 User Program	114
5.54.1 Detailed Description	114
5.55 Bootloader	115
5.55.1 Detailed Description	115
5.56 Demo for Nucleo-L552ZE/GCC	116
5.56.1 Detailed Description	116
5.57 User Program	117
5.57.1 Detailed Description	117
5.58 Bootloader	118
5.58.1 Detailed Description	118
5.59 Demo for Nucleo-L552ZE/IAR	119
5.59.1 Detailed Description	119
5.60 User Program	120
5.60.1 Detailed Description	120
5.61 Bootloader	121
5.61.1 Detailed Description	121
5.62 Demo for Nucleo-L552ZE/Keil	122
5.62.1 Detailed Description	122
5.63 User Program	123
5.63.1 Detailed Description	123
5.64 Bootloader	124
5.64.1 Detailed Description	124
5.65 Demo for Olimex EM-32G880F128-STK/GCC	125
5.65.1 Detailed Description	125
5.66 User Program	126
5.66.1 Detailed Description	126
5.67 Bootloader	127
5.67.1 Detailed Description	127

5.68 Demo for Olimex EM-32G880F128-STK/IAR	128
5.68.1 Detailed Description	128
5.69 User Program	129
5.69.1 Detailed Description	129
5.70 Bootloader	130
5.70.1 Detailed Description	130
5.71 Demo for Texas Instruments EK-LM3S6965/GCC	131
5.71.1 Detailed Description	131
5.72 User Program	132
5.72.1 Detailed Description	132
5.73 Bootloader	133
5.73.1 Detailed Description	133
5.74 Demo for Texas Instruments EK-LM3S6965/IAR	134
5.74.1 Detailed Description	134
5.75 User Program	135
5.75.1 Detailed Description	135
5.76 Bootloader	136
5.76.1 Detailed Description	136
5.77 Demo for Texas Instruments EK-LM3S8962/GCC	137
5.77.1 Detailed Description	137
5.78 User Program	138
5.78.1 Detailed Description	138
5.79 Bootloader	139
5.79.1 Detailed Description	139
5.80 Demo for Texas Instruments EK-LM3S8962/IAR	140
5.80.1 Detailed Description	140
5.81 User Program	141
5.81.1 Detailed Description	141
5.82 Bootloader	142
5.82.1 Detailed Description	142

5.83 Demo for Nucleo-F103RB/STM32CubeIDE	143
5.83.1 Detailed Description	143
5.84 User Program	144
5.84.1 Detailed Description	144
5.85 Bootloader	145
5.85.1 Detailed Description	145
5.86 Demo for Nucleo-F103RB/GCC	146
5.86.1 Detailed Description	146
5.87 User Program	147
5.87.1 Detailed Description	147
5.88 Bootloader	148
5.88.1 Detailed Description	148
5.89 Demo for Nucleo-F103RB	149
5.89.1 Detailed Description	149
5.90 User Program	150
5.90.1 Detailed Description	150
5.91 Bootloader	151
5.91.1 Detailed Description	151
5.92 Demo for Nucleo-F103RB/Keil	152
5.92.1 Detailed Description	152
5.93 User Program	153
5.93.1 Detailed Description	153
5.94 Bootloader	154
5.94.1 Detailed Description	154
5.95 Demo for Olimex STM32-H103/STM32CubeIDE	155
5.95.1 Detailed Description	155
5.96 User Program	156
5.96.1 Detailed Description	156
5.97 Bootloader	157
5.97.1 Detailed Description	157

5.98 Demo for Olimex STM32-H103/GCC	158
5.98.1 Detailed Description	158
5.99 User Program	159
5.99.1 Detailed Description	159
5.100 Bootloader	160
5.100.1 Detailed Description	160
5.101 Demo for Olimex STM32-H103/IAR	161
5.101.1 Detailed Description	161
5.102 User Program	162
5.102.1 Detailed Description	162
5.103 Bootloader	163
5.103.1 Detailed Description	163
5.104 Demo for Olimex STM32-H103/Keil	164
5.104.1 Detailed Description	164
5.105 User Program	165
5.105.1 Detailed Description	165
5.106 Bootloader	166
5.106.1 Detailed Description	166
5.107 Demo for Olimex STM32-P103/STM32CubeIDE	167
5.107.1 Detailed Description	167
5.108 User Program	168
5.108.1 Detailed Description	168
5.109 Bootloader	169
5.109.1 Detailed Description	169
5.110 Demo for Olimex STM32-P103/GCC	170
5.110.1 Detailed Description	170
5.111 User Program	171
5.111.1 Detailed Description	171
5.112 Bootloader	172
5.112.1 Detailed Description	172

5.113 Demo for Olimex STM32-P103/IAR	173
5.113.1 Detailed Description	173
5.114 User Program	174
5.114.1 Detailed Description	174
5.115 Bootloader	175
5.115.1 Detailed Description	175
5.116 Demo for Olimex STM32-P103/Keil	176
5.116.1 Detailed Description	176
5.117 User Program	177
5.117.1 Detailed Description	177
5.118 Bootloader	178
5.118.1 Detailed Description	178
5.119 Demo for Olimexino-STM32/STM32CubeIDE	179
5.119.1 Detailed Description	179
5.120 User Program	180
5.120.1 Detailed Description	180
5.121 Bootloader	181
5.121.1 Detailed Description	181
5.122 Demo for Olimexino-STM32/GCC	182
5.122.1 Detailed Description	182
5.123 User Program	183
5.123.1 Detailed Description	183
5.124 Bootloader	184
5.124.1 Detailed Description	184
5.125 Demo for Olimexino-STM32/IAR	185
5.125.1 Detailed Description	185
5.126 User Program	186
5.126.1 Detailed Description	186
5.127 Bootloader	187
5.127.1 Detailed Description	187

5.128 Demo for Olimexino-STM32/Keil	188
5.128.1 Detailed Description	188
5.129 User Program	189
5.129.1 Detailed Description	189
5.130 Bootloader	190
5.130.1 Detailed Description	190
5.131 Demo for Olimex STM32-P207/STM32CubeIDE	191
5.131.1 Detailed Description	191
5.132 User Program	192
5.132.1 Detailed Description	192
5.133 Bootloader	193
5.133.1 Detailed Description	193
5.134 Demo for Olimex STM32-P207/GCC	194
5.134.1 Detailed Description	194
5.135 User Program	195
5.135.1 Detailed Description	195
5.136 Bootloader	196
5.136.1 Detailed Description	196
5.137 Demo for Olimex STM32-P207/IAR	197
5.137.1 Detailed Description	197
5.138 User Program	198
5.138.1 Detailed Description	198
5.139 Bootloader	199
5.139.1 Detailed Description	199
5.140 Demo for Olimex STM32-P207/Keil	200
5.140.1 Detailed Description	200
5.141 User Program	201
5.141.1 Detailed Description	201
5.142 Bootloader	202
5.142.1 Detailed Description	202

5.143 Demo for S32K144EVB/GCC	203
5.143.1 Detailed Description	203
5.144 User Program	204
5.144.1 Detailed Description	204
5.145 Bootloader	205
5.145.1 Detailed Description	205
5.146 Demo for S32K144EVB/IAR	206
5.146.1 Detailed Description	206
5.147 User Program	207
5.147.1 Detailed Description	207
5.148 Bootloader	208
5.148.1 Detailed Description	208
5.149 Demo for STM32F3-Discovery/STM32CubeIDE	209
5.149.1 Detailed Description	209
5.150 User Program	210
5.150.1 Detailed Description	210
5.151 Bootloader	211
5.151.1 Detailed Description	211
5.152 Demo for STM32F3-Discovery/GCC	212
5.152.1 Detailed Description	212
5.153 User Program	213
5.153.1 Detailed Description	213
5.154 Bootloader	214
5.154.1 Detailed Description	214
5.155 Demo for STM32F3-Discovery/IAR	215
5.155.1 Detailed Description	215
5.156 User Program	216
5.156.1 Detailed Description	216
5.157 Bootloader	217
5.157.1 Detailed Description	217

5.158 Demo for STM32F3-Discovery/Keil	218
5.158.1 Detailed Description	218
5.159 User Program	219
5.159.1 Detailed Description	219
5.160 Bootloader	220
5.160.1 Detailed Description	220
5.161 Demo for Nucleo-F303K8/STM32CubeIDE	221
5.161.1 Detailed Description	221
5.162 User Program	222
5.162.1 Detailed Description	222
5.163 Bootloader	223
5.163.1 Detailed Description	223
5.164 Demo for Nucleo-F303K8/GCC	224
5.164.1 Detailed Description	224
5.165 User Program	225
5.165.1 Detailed Description	225
5.166 Bootloader	226
5.166.1 Detailed Description	226
5.167 Demo for Nucleo-F303K8/IAR	227
5.167.1 Detailed Description	227
5.168 User Program	228
5.168.1 Detailed Description	228
5.169 Bootloader	229
5.169.1 Detailed Description	229
5.170 Demo for Nucleo-F303K8/Keil	230
5.170.1 Detailed Description	230
5.171 User Program	231
5.171.1 Detailed Description	231
5.172 Bootloader	232
5.172.1 Detailed Description	232

5.173 Demo for Nucleo-F429ZI/STM32CubeIDE	233
5.173.1 Detailed Description	233
5.174 User Program	234
5.174.1 Detailed Description	234
5.175 Bootloader	235
5.175.1 Detailed Description	235
5.176 Demo for Nucleo-F429ZI/GCC	236
5.176.1 Detailed Description	236
5.177 User Program	237
5.177.1 Detailed Description	237
5.178 Bootloader	238
5.178.1 Detailed Description	238
5.179 Demo for Nucleo-F429ZI/IAR	239
5.179.1 Detailed Description	239
5.180 User Program	240
5.180.1 Detailed Description	240
5.181 Bootloader	241
5.181.1 Detailed Description	241
5.182 Demo for Nucleo-F429ZI/Keil	242
5.182.1 Detailed Description	242
5.183 User Program	243
5.183.1 Detailed Description	243
5.184 Bootloader	244
5.184.1 Detailed Description	244
5.185 Demo for Olimex STM32-P405/STM32CubeIDE	245
5.185.1 Detailed Description	245
5.186 User Program	246
5.186.1 Detailed Description	246
5.187 Bootloader	247
5.187.1 Detailed Description	247

5.188 Demo for Olimex STM32-P405/GCC	248
5.188.1 Detailed Description	248
5.189 User Program	249
5.189.1 Detailed Description	249
5.190 Bootloader	250
5.190.1 Detailed Description	250
5.191 Demo for Olimex STM32-P405/IAR	251
5.191.1 Detailed Description	251
5.192 User Program	252
5.192.1 Detailed Description	252
5.193 Bootloader	253
5.193.1 Detailed Description	253
5.194 Demo for Olimex STM32-P405/Keil	254
5.194.1 Detailed Description	254
5.195 User Program	255
5.195.1 Detailed Description	255
5.196 Bootloader	256
5.196.1 Detailed Description	256
5.197 Demo for Nucleo-L476RG/STM32CubeIDE	257
5.197.1 Detailed Description	257
5.198 User Program	258
5.198.1 Detailed Description	258
5.199 Bootloader	259
5.199.1 Detailed Description	259
5.200 Demo for Nucleo-L476RG/GCC	260
5.200.1 Detailed Description	260
5.201 User Program	261
5.201.1 Detailed Description	261
5.202 Bootloader	262
5.202.1 Detailed Description	262

5.203 Demo for Nucleo-L476RG/IAR	263
5.203.1 Detailed Description	263
5.204 User Program	264
5.204.1 Detailed Description	264
5.205 Bootloader	265
5.205.1 Detailed Description	265
5.206 Demo for Nucleo-L476RG/Keil	266
5.206.1 Detailed Description	266
5.207 User Program	267
5.207.1 Detailed Description	267
5.208 Bootloader	268
5.208.1 Detailed Description	268
5.209 Demo for Texas Instruments DK-TM4C123G/IAR	269
5.209.1 Detailed Description	269
5.210 User Program	270
5.210.1 Detailed Description	270
5.211 Bootloader	271
5.211.1 Detailed Description	271
5.212 Demo for XMC4700 Relax Kit/GCC	272
5.212.1 Detailed Description	272
5.213 User Program	273
5.213.1 Detailed Description	273
5.214 Bootloader	274
5.214.1 Detailed Description	274
5.215 Demo for XMC4700 Relax Kit/IAR	275
5.215.1 Detailed Description	275
5.216 User Program	276
5.216.1 Detailed Description	276
5.217 Bootloader	277
5.217.1 Detailed Description	277

5.218 Demo for Nucleo-F746ZG/STM32CubeIDE	278
5.218.1 Detailed Description	278
5.219 User Program	279
5.219.1 Detailed Description	279
5.220 Bootloader	280
5.220.1 Detailed Description	280
5.221 Demo for Nucleo-F746ZG/GCC	281
5.221.1 Detailed Description	281
5.222 User Program	282
5.222.1 Detailed Description	282
5.223 Bootloader	283
5.223.1 Detailed Description	283
5.224 Demo for Nucleo-F746ZG/IAR	284
5.224.1 Detailed Description	284
5.225 User Program	285
5.225.1 Detailed Description	285
5.226 Bootloader	286
5.226.1 Detailed Description	286
5.227 Demo for Nucleo-F746ZG/Keil	287
5.227.1 Detailed Description	287
5.228 User Program	288
5.228.1 Detailed Description	288
5.229 Bootloader	289
5.229.1 Detailed Description	289
5.230 Demo for Nucleo-F767ZI/STM32CubeIDE	290
5.230.1 Detailed Description	290
5.231 User Program	291
5.231.1 Detailed Description	291
5.232 Bootloader	292
5.232.1 Detailed Description	292

5.233 Demo for Nucleo-F767ZI/GCC	293
5.233.1 Detailed Description	293
5.234 User Program	294
5.234.1 Detailed Description	294
5.235 Bootloader	295
5.235.1 Detailed Description	295
5.236 Demo for Nucleo-F767ZI/IAR	296
5.236.1 Detailed Description	296
5.237 User Program	297
5.237.1 Detailed Description	297
5.238 Bootloader	298
5.238.1 Detailed Description	298
5.239 Demo for Nucleo-F767ZI/Keil	299
5.239.1 Detailed Description	299
5.240 User Program	300
5.240.1 Detailed Description	300
5.241 Bootloader	301
5.241.1 Detailed Description	301
5.242 Demo for Nucleo-H743ZI/STM32CubeIDE	302
5.242.1 Detailed Description	302
5.243 User Program	303
5.243.1 Detailed Description	303
5.244 Bootloader	304
5.244.1 Detailed Description	304
5.245 Demo for Nucleo-H743ZI/GCC	305
5.245.1 Detailed Description	305
5.246 User Program	306
5.246.1 Detailed Description	306
5.247 Bootloader	307
5.247.1 Detailed Description	307

5.248 Demo for Nucleo-H743ZI/IAR	308
5.248.1 Detailed Description	308
5.249 User Program	309
5.249.1 Detailed Description	309
5.250 Bootloader	310
5.250.1 Detailed Description	310
5.251 Demo for Nucleo-H743ZI/Keil	311
5.251.1 Detailed Description	311
5.252 User Program	312
5.252.1 Detailed Description	312
5.253 Bootloader Demos	313
5.253.1 Detailed Description	316
5.254 Bootloader	317
5.254.1 Detailed Description	317
5.255 Demo for NXP DevKit-S12G128/CodeWarrior	318
5.255.1 Detailed Description	318
5.256 User Program	319
5.256.1 Detailed Description	319
5.257 Bootloader	320
5.257.1 Detailed Description	320
5.258 Demo for Dragon12-plus/CodeWarrior	321
5.258.1 Detailed Description	321
5.259 User Program	322
5.259.1 Detailed Description	322
5.260 CAN driver of a port	323
5.260.1 Detailed Description	323
5.261 CPU driver of a port	324
5.261.1 Detailed Description	324
5.262 Flash driver of a port	325
5.262.1 Detailed Description	325

5.263	Compiler specifics of a port	326
5.263.1	Detailed Description	326
5.264	Non-volatile memory driver of a port	327
5.264.1	Detailed Description	327
5.265	RS232 UART driver of a port	328
5.265.1	Detailed Description	328
5.266	Target Port Template	329
5.266.1	Detailed Description	329
5.267	Timer driver of a port	330
5.267.1	Detailed Description	330
5.268	Type definitions of a port	331
5.268.1	Detailed Description	331
5.269	USB driver of a port	332
5.269.1	Detailed Description	332
5.270	Target ARMCM0 S32K11	333
5.270.1	Detailed Description	333
5.271	Target ARMCM0 STM32F0	334
5.271.1	Detailed Description	334
5.272	Target ARMCM0 STM32G0	335
5.272.1	Detailed Description	335
5.273	Target ARMCM0 XMC1	336
5.273.1	Detailed Description	336
5.274	Target ARMCM33 STM32L5	337
5.274.1	Detailed Description	337
5.275	Target ARMCM3 EFM32	338
5.275.1	Detailed Description	338
5.276	Target ARMCM3 LM3S	339
5.276.1	Detailed Description	339
5.277	Target ARMCM3 STM32F1	340
5.277.1	Detailed Description	340

5.278	Target ARMCM3 STM32F2	341
5.278.1	Detailed Description	341
5.279	Target ARMCM4 S32K14	342
5.279.1	Detailed Description	342
5.280	Target ARMCM4 STM32F3	343
5.280.1	Detailed Description	343
5.281	Target ARMCM4 STM32F4	344
5.281.1	Detailed Description	344
5.282	Target ARMCM4 STM32L4	345
5.282.1	Detailed Description	345
5.283	Target ARMCM4 TM4C	346
5.283.1	Detailed Description	346
5.284	Target ARMCM4 XMC4	347
5.284.1	Detailed Description	347
5.285	Target ARMCM7 STM32F7	348
5.285.1	Detailed Description	348
5.286	Target ARMCM7 STM32H7	349
5.286.1	Detailed Description	349
5.287	Bootloader Core	350
5.287.1	Detailed Description	351
5.288	Target HCS12	352
5.288.1	Detailed Description	352
5.289	Bootloader Ports	353
5.289.1	Detailed Description	353

Chapter 1

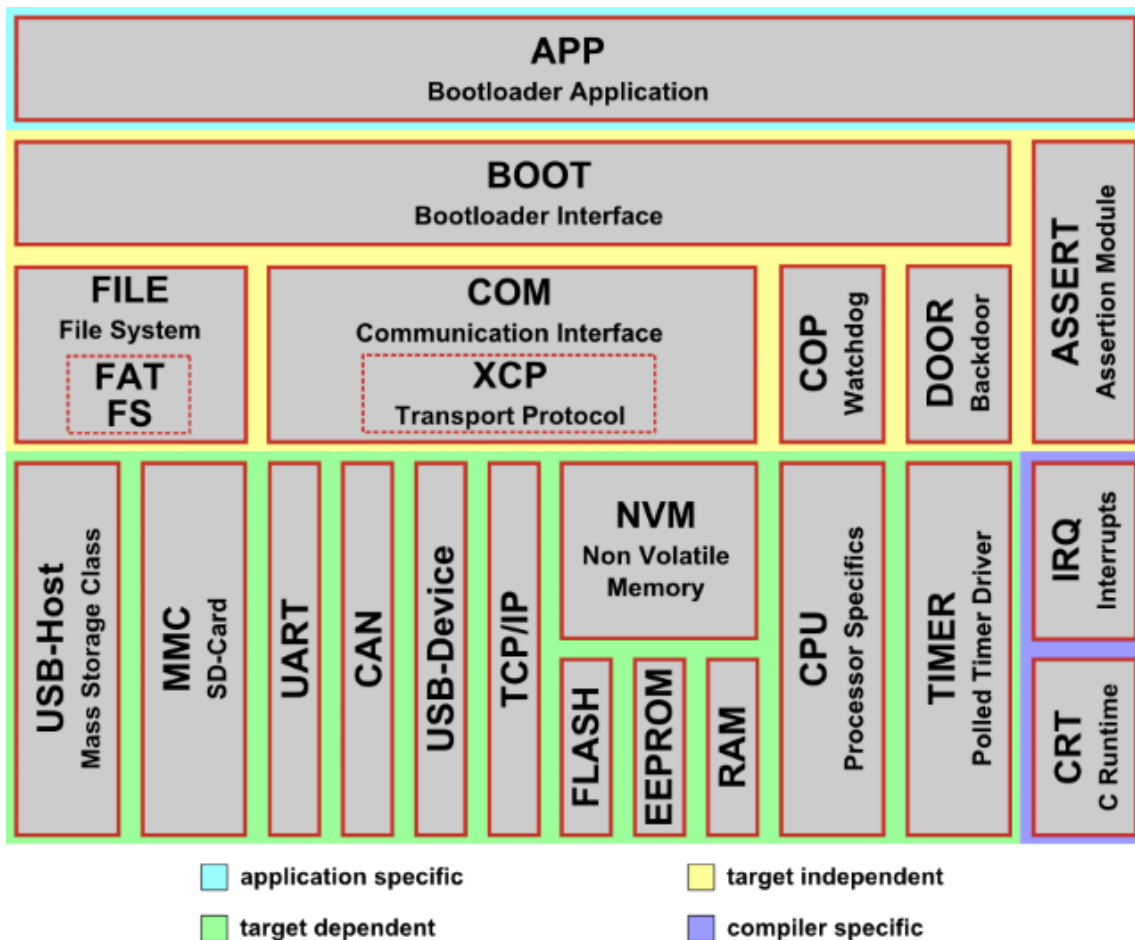

OpenBLT Firmware Documentation

1.1 Introduction

This documentation covers the OpenBLT (Open source BootLoader Tool) firmware. With OpenBLT you can make software updates through an on-chip communication interface (RS232, CAN, TCP/IP, USB etc.), without the need of specialized debugger hardware.

1.2 Software Architecture

The software program's architecture is divided into 4 major categories, namely the application code (App), target independent code (Core), target dependent code (Target), and compiler specific code (Comp).

To configure and fine-tune the bootloader for integration in your product, all you have to do is take the demo bootloader project for the microcontroller and compiler you are using, and (optionally) modify just the application code (App) to fit your needs. This typically involves changing the configuration header file (blt_conf.h) and the implementation of the hook functions (hooks.c).

For more in-depth information behind the design of the OpenBLT bootloader, you can visit: <https://www.feaser.com/openblt/doku.php?id=manual:design>.

Chapter 3

Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

tCanBusTiming	Structure type for grouping CAN bus timing related information	355
tCanRegs	Structure type with the layout of the CAN related control registers	358
tCanRxMsgSlot	Structure type with the layout of a CAN reception message slot	363
tCanTxMsgSlot	Structure type with the layout of a CAN transmit message slot	364
tFatFsObjects	Structure type for grouping FATFS related objects used by this module	365
tFifoCtrl	Structure type for fifo control	366
tFifoPipe	Structure type for a fifo pipe	368
tFileEraseInfo	Structure type with information for the memory erase opeartion	369
tFlashBlockInfo	Structure type for grouping flash block information	370
tFlashPrescalerSysclockMapping	Mapping table for finding the corect flash clock divider prescaler	371
tFlashRegs	Structure type for the flash control registers	372
tFlashSector	Flash sector descriptor type	375
tIsrFunc	Structure type for vector table entries	377
tSharedParamsBuffer	Layout of the shared parameters RAM buffer	378
tSrecLineParseObject	Structure type for grouping the parsing results of an S-record line	378
tSysTickRegs	Systick registers	380
tTimerRegs	Structure type with the layout of the timer related control registers	380
tXcpInfo	Structure type for grouping XCP internal module information	383

[uip_tcp_appstate_t](#)

Define the [uip_tcp_appstate_t](#) datatype. This is the state of our tcp/ip application, and the memory required for this state is allocated together with each TCP connection. One application state for each TCP connection [385](#)

Chapter 5

Module Documentation

5.1 Bootloader

Bootloader.

Files

- file [_template/Boot/blt_conf.h](#)
Bootloader configuration header file.
- file [_template/Boot/hooks.c](#)
Bootloader callback source file.
- file [_template/Boot/led.c](#)
LED driver source file.
- file [_template/Boot/led.h](#)
LED driver header file.
- file [_template/Boot/main.c](#)
Bootloader application source file.

5.1.1 Detailed Description

Bootloader.

5.2 Template for demo programs

Template for creating OpenBLT demo programs.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.2.1 Detailed Description

Template for creating OpenBLT demo programs.

These template programs for a foundation when creating OpenBLT demo programs. For compilation testing these template demo programs are preconfigured for building with GCC and a Makefile. Other already existing demo programs can serve as a reference when creating OpenBLT demo programs based on this template. The demo bootloader and demo user program templates contain instructions in source code comments of what functionality needs to be implemented where. Search for "TODO ##Boot" and "TODO ##Prog" to find these comments in the template source files.

5.3 User Program

User Program.

Files

- file [Demo/_template/Prog/boot.c](#)
Demo program bootloader interface source file.
- file [Demo/_template/Prog/boot.h](#)
Demo program bootloader interface header file.
- file [_template/Prog/header.h](#)
Generic header file.
- file [_template/Prog/led.c](#)
LED driver source file.
- file [_template/Prog/led.h](#)
LED driver header file.
- file [_template/Prog/main.c](#)
Demo program application source file.
- file [Demo/_template/Prog/timer.c](#)
Timer driver source file.
- file [Demo/_template/Prog/timer.h](#)
Timer driver header file.

5.3.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. This demo user program is a template that can be used as a starting point for creating your own demo user program.

5.4 Bootloader

Bootloader.

Bootloader.

5.5 Demo for S32K118EVB/GCC

Preconfigured programs for the NXP S32K118EVB board and the S32 Design Studio development environment, which is based on the ARM GCC toolchain.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.5.1 Detailed Description

Preconfigured programs for the NXP S32K118EVB board and the S32 Design Studio development environment, which is based on the ARM GCC toolchain.

5.6 User Program

User Program.

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. This demo user program is a template that can be used as a starting point for creating your own demo user program.

5.7 Bootloader

Bootloader.

Bootloader.

5.8 Demo for S32K118EVB/IAR

Preconfigured programs for the NXP S32K118EVB board and the IAR Embedded Workbench for ARM.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.8.1 Detailed Description

Preconfigured programs for the NXP S32K118EVB board and the IAR Embedded Workbench for ARM.

5.9 User Program

User Program.

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. This demo user program is a template that can be used as a starting point for creating your own demo user program.

5.10 Bootloader

Bootloader.

Files

- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/app.c](#)
Bootloader application source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/app.h](#)
Bootloader application header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/blt_conf.h](#)
Bootloader configuration header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/flash_layout.c](#)
Custom flash layout table source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/hooks.c](#)
Bootloader callback source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/led.h](#)
LED driver header file.

5.10.1 Detailed Description

Bootloader.

5.11 Demo for STM32F0-Discovery/STM32CubeIDE

Preconfigured programs for the STM32F0-Discovery board and the ST STM32CubeIDE toolchain.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.11.1 Detailed Description

Preconfigured programs for the STM32F0-Discovery board and the ST STM32CubeIDE toolchain.

Refer to <http://feaser.com/openblt/doku.php?id=manual:demos>

For detailed getting started instructions, refer to: https://www.feaser.com/openblt/doku.php?id=manual:demos:stm32f0_discovery_cubeide.

5.12 User Program

User Program.

Files

- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/app.c](#)
User program application source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/app.h](#)
User program application header file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/boot.c](#)
Demo program bootloader interface source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/boot.h](#)
Demo program bootloader interface header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/header.h](#)
Generic header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/led.h](#)
LED driver header file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/timer.c](#)
Timer driver source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/timer.h](#)
Timer driver header file.

5.12.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm0_stm32.

5.13 Bootloader

Bootloader.

Files

- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Boot/blt_conf.h](#)
Bootloader configuration header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Boot/flash_layout.c](#)
Custom flash layout table source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Boot/hooks.c](#)
Bootloader callback source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Boot/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Boot/led.h](#)
LED driver header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Boot/main.c](#)
Bootloader application source file.

5.13.1 Detailed Description

Bootloader.

5.14 Demo for STM32F0-Discovery/GCC

Preconfigured programs for the STM32F0-Discovery board and the GCC compiler.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.14.1 Detailed Description

Preconfigured programs for the STM32F0-Discovery board and the GCC compiler.

Refer to <http://feaser.com/openblt/doku.php?id=manual:demos>

For detailed getting started instructions, refer to: https://www.feaser.com/openblt/doku.php?id=manual:demos:stm32f0_discovery_gcc.

5.15 User Program

User Program.

Files

- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/boot.c](#)
Demo program bootloader interface source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/boot.h](#)
Demo program bootloader interface header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/header.h](#)
Generic header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/led.h](#)
LED driver header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/main.c](#)
Demo program application source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/timer.c](#)
Timer driver source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/timer.h](#)
Timer driver header file.

5.15.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm0_stm32.

5.16 Bootloader

Bootloader.

Files

- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Boot/blt_conf.h](#)
Bootloader configuration header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Boot/flash_layout.c](#)
Custom flash layout table source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Boot/hooks.c](#)
Bootloader callback source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Boot/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Boot/led.h](#)
LED driver header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Boot/main.c](#)
Bootloader application source file.

5.16.1 Detailed Description

Bootloader.

5.17 Demo for STM32F0-Discovery/IAR

Preconfigured programs for the STM32F0-Discovery board and the IAR Embedded Workbench IDE.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.17.1 Detailed Description

Preconfigured programs for the STM32F0-Discovery board and the IAR Embedded Workbench IDE.

For detailed getting started instructions, refer to: https://www.feaser.com/openblt/doku.php?id=manual:demos:stm32f0_discovery_iar.

5.18 User Program

User Program.

Files

- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/boot.c](#)
Demo program bootloader interface source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/boot.h](#)
Demo program bootloader interface header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/header.h](#)
Generic header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/led.h](#)
LED driver header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/main.c](#)
Demo program application source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/timer.c](#)
Timer driver source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/timer.h](#)
Timer driver header file.

5.18.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm0_stm32.

5.19 Bootloader

Bootloader.

Files

- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Boot/blt_conf.h](#)
Bootloader configuration header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Boot/flash_layout.c](#)
Custom flash layout table source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Boot/hooks.c](#)
Bootloader callback source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Boot/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Boot/led.h](#)
LED driver header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Boot/main.c](#)
Bootloader application source file.

5.19.1 Detailed Description

Bootloader.

5.20 Demo for STM32F0-Discovery/Keil

Preconfigured programs for the STM32F0-Discovery board and the Keil MDK toolchain.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.20.1 Detailed Description

Preconfigured programs for the STM32F0-Discovery board and the Keil MDK toolchain.

Refer to <http://feaser.com/openblt/doku.php?id=manual:demos>

For detailed getting started instructions, refer to: https://www.feaser.com/openblt/doku.php?id=manual:demos:stm32f0_discovery_keil.

5.21 User Program

User Program.

Files

- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/boot.c](#)
Demo program bootloader interface source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/boot.h](#)
Demo program bootloader interface header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/header.h](#)
Generic header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/led.h](#)
LED driver header file.
- file [ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/main.c](#)
Demo program application source file.

Timer driver source file.
- file [Demo/ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/timer.h](#)
Timer driver header file.

5.21.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm0_stm32.

5.22 Bootloader

Bootloader.

Files

- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/app.c](#)
Bootloader application source file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/app.h](#)
Bootloader application header file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/blt_conf.h](#)
Bootloader configuration header file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/hooks.c](#)
Bootloader callback source file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/led.c](#)
LED driver source file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/led.h](#)
LED driver header file.

5.22.1 Detailed Description

Bootloader.

5.23 Demo for Nucleo-F091RC/STM32CubeIDE

Preconfigured programs for the Nucleo-F091RC and the ST STM32CubeIDE toolchain.

Modules

- [Bootloader](#)
Bootloader.
- [User Program](#)
User Program.

5.23.1 Detailed Description

Preconfigured programs for the Nucleo-F091RC and the ST STM32CubeIDE toolchain.

Refer to <http://feaser.com/openblt/doku.php?id=manual:demos>

For detailed getting started instructions, refer to: https://www.feaser.com/openblt/doku.php?id=manual:demos:nucleo_f091rc_cubeide.

5.24 User Program

User Program.

Files

- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/app.c](#)
User program application source file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/app.h](#)
User program application header file.
- file [Demo/ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/boot.c](#)
Demo program bootloader interface source file.
- file [Demo/ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/boot.h](#)
Demo program bootloader interface header file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/header.h](#)
Generic header file.
- file [ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/led.c](#)
LED driver source file.

5.30.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm0_stm32.

5.57.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm33_stm32l5.

Demo program interrupt vectors source file.

5.81.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm3_lm3s.

5.105.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: <https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm3-stm32>.

Timer driver header file.

5.132.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm3_stm32f2.

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm4_stm32f3.

5.180.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm4_stm32.

Timer driver header file.

5.207.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm4_stm32l4.

Timer driver header file.

5.231.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm7_stm32f7.

- file [Demo/ARMCM7_STM32H7_Nucleo_H743ZI_Keil/Prog/timer.c](#)
Timer driver source file.
- file [Demo/ARMCM7_STM32H7_Nucleo_H743ZI_Keil/Prog/timer.h](#)
Timer driver header file.

5.252.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: https://www.feaser.com/openblt/doku.php?id=manual:ports:armcm7_stm32h7.

5.253 Bootloader Demos

Preconfigured demo programs.

Modules

- [Template for demo programs](#)
Template for creating OpenBLT demo programs.
- [Demo for S32K118EVB/GCC](#)
Preconfigured programs for the NXP S32K118EVB board and the S32 Design Studio development environment, which is based on the ARM GCC toolchain.
- [Demo for S32K118EVB/IAR](#)
Preconfigured programs for the NXP S32K118EVB board and the IAR Embedded Workbench for ARM.
- [Demo for STM32F0-Discovery/STM32CubeIDE](#)
Preconfigured programs for the STM32F0-Discovery board and the ST STM32CubeIDE toolchain.
- [Demo for STM32F0-Discovery/GCC](#)
Preconfigured programs for the STM32F0-Discovery board and the GCC compiler.
- [Demo for STM32F0-Discovery/IAR](#)
Preconfigured programs for the STM32F0-Discovery board and the IAR Embedded Workbench IDE.
- [Demo for STM32F0-Discovery/Keil](#)
Preconfigured programs for the STM32F0-Discovery board and the Keil MDK toolchain.
- [Demo for Nucleo-F091RC/STM32CubeIDE](#)
Preconfigured programs for the Nucleo-F091RC and the ST STM32CubeIDE toolchain.
- [Demo for Nucleo-F091RC/GCC](#)
Preconfigured programs for the Nucleo-F091RC and the GNU ARM GCC compiler.
- [Demo for Nucleo-F091RC/IAR](#)
Preconfigured programs for the Nucleo-F091RC board and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-F091RC/Keil](#)
Preconfigured programs for the Nucleo-F091RC and the Keil MDK toolchain.
- [Demo for Nucleo-G071RB/STM32CubeIDE](#)
Preconfigured programs for the Nucleo-G071RB and the ST STM32CubeIDE toolchain.
- [Demo for Nucleo-G071RB/GCC](#)
Preconfigured programs for the Nucleo-G071RB and the GNU ARM GCC compiler.
- [Demo for Nucleo-G071RB/IAR](#)
Preconfigured programs for the Nucleo-G071RB and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-G071RB/Keil](#)
Preconfigured programs for the Nucleo-G071RB and the Keil MDK toolchain.
- [Demo for XMC1400 Boot Kit/GCC](#)
Preconfigured programs for the Infineon XMC1400 Boot Kit board and the Dave 4 development environment, which is based on the ARM GCC toolchain.
- [Demo for XMC1400 Boot Kit/IAR](#)
Preconfigured programs for the Infineon XMC1400 Boot Kit board and the IAR compiler.
- [Demo for Nucleo-L552ZE/STM32CubeIDE](#)
Preconfigured programs for the Nucleo-L552ZE board and the ST STM32CubeIDE toolchain.
- [Demo for Nucleo-L552ZE/GCC](#)
Preconfigured programs for the Nucleo-L552ZE board and the GNU ARM GCC compiler.
- [Demo for Nucleo-L552ZE/IAR](#)
Preconfigured programs for the Nucleo-L552ZE board and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-L552ZE/Keil](#)
Preconfigured programs for the Nucleo-L552ZE board and the Keil MDK for ARM IDE.

- [Demo for Olimex EM-32G880F128-STK/GCC](#)
Preconfigured programs for the Olimex EM-32G880F128-STK and the GCC compiler.
- [Demo for Olimex EM-32G880F128-STK/IAR](#)
Preconfigured programs for the Olimex EM-32G880F128-STK and the IAR Embedded Workbench IDE.
- [Demo for Texas Instruments EK-LM3S6965/GCC](#)
Preconfigured programs for the Texas Instruments EK-LM3S6965 and the GCC compiler.
- [Demo for Texas Instruments EK-LM3S6965/IAR](#)
Preconfigured programs for the Texas Instruments EK-LM3S6965 and the IAR Embedded Workbench IDE.
- [Demo for Texas Instruments EK-LM3S8962/GCC](#)
Preconfigured programs for the Texas Instruments EK-LM3S8962 and the GCC compiler.
- [Demo for Texas Instruments EK-LM3S8962/IAR](#)
Preconfigured programs for the Texas Instruments EK-LM3S8962 and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-F103RB/STM32CubeIDE](#)
Preconfigured programs for the Nucleo-F103RB and the ST STM32CubeIDE toolchain.
- [Demo for Nucleo-F103RB/GCC](#)
Preconfigured programs for the Nucleo-F103RB and the GNU ARM GCC compiler.
- [Demo for Nucleo-F103RB](#)
Preconfigured programs for the Nucleo-F103RB and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-F103RB/Keil](#)
Preconfigured programs for the Nucleo-F103RB and the Keil MDK toolchain.
- [Demo for Olimex STM32-H103/STM32CubeIDE](#)
Preconfigured programs for the Olimex STM32-H103 and the ST STM32CubeIDE toolchain.
- [Demo for Olimex STM32-H103/GCC](#)
Preconfigured programs for the Olimex STM32-H103 and the GCC compiler.
- [Demo for Olimex STM32-H103/IAR](#)
Preconfigured programs for the Olimex STM32-H103 and the IAR Embedded Workbench IDE.
- [Demo for Olimex STM32-H103/Keil](#)
Preconfigured programs for the Olimex STM32-H103 and the Keil MDK for ARM IDE.
- [Demo for Olimex STM32-P103/STM32CubeIDE](#)
Preconfigured programs for the Olimex STM32-P103 and the ST STM32CubeIDE toolchain.
- [Demo for Olimex STM32-P103/GCC](#)
Preconfigured programs for the Olimex STM32-P103 and the GCC compiler.
- [Demo for Olimex STM32-P103/IAR](#)
Preconfigured programs for the Olimex STM32-P103 and the IAR Embedded Workbench IDE.
- [Demo for Olimex STM32-P103/Keil](#)
Preconfigured programs for the Olimex STM32-P103 and the Keil MDK toolchain.
- [Demo for Olimexino-STM32/STM32CubeIDE](#)
Preconfigured programs for the Olimexino-STM32 and the ST STM32CubeIDE toolchain.
- [Demo for Olimexino-STM32/GCC](#)
Preconfigured programs for the Olimexino-STM32 and the GCC compiler.
- [Demo for Olimexino-STM32/IAR](#)
Preconfigured programs for the Olimexino-STM32 and the IAR Embedded Workbench.
- [Demo for Olimexino-STM32/Keil](#)
Preconfigured programs for the Olimexino-STM32 and the Keil MDK toolchain.
- [Demo for Olimex STM32-P207/STM32CubeIDE](#)
Preconfigured programs for the Olimex STM32-P207 and the STM32CubeIDE toolchain.
- [Demo for Olimex STM32-P207/GCC](#)
Preconfigured programs for the Olimex STM32-P207 and the GCC compiler.
- [Demo for Olimex STM32-P207/IAR](#)
Preconfigured programs for the Olimex STM32-P207 and the IAR Embedded Workbench.
- [Demo for Olimex STM32-P207/Keil](#)

- Preconfigured programs for the Olimex STM32-P207 and the Keil MDK toolchain.*

 - [Demo for S32K144EVB/GCC](#)

Preconfigured programs for the NXP S32K144EVB board and the S32 Design Studio development environment, which is based on the ARM GCC toolchain.
- [Demo for S32K144EVB/IAR](#)

Preconfigured programs for the NXP S32K144EVB board and the IAR Embedded Workbench for ARM.
- [Demo for STM32F3-Discovery/STM32CubeIDE](#)

Preconfigured programs for the STM32F3-Discovery board and the ST STM32CubeIDE toolchain.
- [Demo for STM32F3-Discovery/GCC](#)

Preconfigured programs for the STM32F3-Discovery board and the ARM GNU Embedded toolchain.
- [Demo for STM32F3-Discovery/IAR](#)

Preconfigured programs for the STM32F3-Discovery board and the IAR Embedded Workbench.
- [Demo for STM32F3-Discovery/Keil](#)

Preconfigured programs for the STM32F3-Discovery board and the Keil MDK for ARM IDE.
- [Demo for Nucleo-F303K8/STM32CubeIDE](#)

Preconfigured programs for the Nucleo-F303K8 and the ST STM32CubeIDE toolchain.
- [Demo for Nucleo-F303K8/GCC](#)

Preconfigured programs for the Nucleo-F303K8 and the ARM GNU Embedded toolchain.
- [Demo for Nucleo-F303K8/IAR](#)

Preconfigured programs for the Nucleo-F303K8 and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-F303K8/Keil](#)

Preconfigured programs for the Nucleo-F303K8 and the Keil MDK toolchain.
- [Demo for Nucleo-F429ZI/STM32CubeIDE](#)

Preconfigured programs for the Nucleo-F429ZI board and the ST STM32CubeIDE toolchain.
- [Demo for Nucleo-F429ZI/GCC](#)

Preconfigured programs for the Nucleo-F429ZI board and the GNU ARM GCC compiler.
- [Demo for Nucleo-F429ZI/IAR](#)

Preconfigured programs for the Nucleo-F429ZI board and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-F429ZI/Keil](#)

Preconfigured programs for the Nucleo-F429ZI board and the Keil MDK toolchain.
- [Demo for Olimex STM32-P405/STM32CubeIDE](#)

Preconfigured programs for the Olimex STM32-P405 and the ST STM32CubeIDE toolchain.
- [Demo for Olimex STM32-P405/GCC](#)

Preconfigured programs for the Olimex STM32-P405 and the GCC compiler.
- [Demo for Olimex STM32-P405/IAR](#)

Preconfigured programs for the Olimex STM32-P405 and the IAR Embedded Workbench IDE.
- [Demo for Olimex STM32-P405/Keil](#)

Preconfigured programs for the Olimex STM32-P405 and the Keil MDK for ARM IDE.
- [Demo for Nucleo-L476RG/STM32CubeIDE](#)

Preconfigured programs for the Nucleo-L476RG and the STM32CubeIDE toolchain.
- [Demo for Nucleo-L476RG/GCC](#)

Preconfigured programs for the Nucleo-L476RG and the GNU ARM GCC compiler.
- [Demo for Nucleo-L476RG/IAR](#)

Preconfigured programs for the Nucleo-L476RG and the IAR Embedded Workbench IDE.
- [Demo for Nucleo-L476RG/Keil](#)

Preconfigured programs for the Nucleo-L476RG and the Keil MDK toolchain.
- [Demo for Texas Instruments DK-TM4C123G/IAR](#)

Preconfigured programs for the Texas Instruments DK-TM4C123G and the IAR Embedded Workbench IDE.
- [Demo for XMC4700 Relax Kit/GCC](#)

Preconfigured programs for the Infineon XMC4700 Relax Kit board and the Dave 4 development environment, which is based on the ARM GCC toolchain.

- [Demo for XMC4700 Relax Kit/IAR](#)

Preconfigured programs for the Infineon XMC4700 Relax Kit board and the IAR compiler.

- [Demo for Nucleo-F746ZG/STM32CubeIDE](#)

Preconfigured programs for the Nucleo-F746ZG board and the ST STM32CubeIDE toolchain.

- [Demo for Nucleo-F746ZG/GCC](#)

Preconfigured programs for the Nucleo-F746ZG board and the GNU ARM GCC compiler.

- [Demo for Nucleo-F746ZG/IAR](#)

Preconfigured programs for the Nucleo-F746ZG board and the IAR Embedded Workbench IDE.

- [Demo for Nucleo-F746ZG/Keil](#)

Preconfigured programs for the Nucleo-F746ZG board and the Keil MDK for ARM IDE.

- [Demo for Nucleo-F767ZI/STM32CubeIDE](#)

Preconfigured programs for the Nucleo-F767ZI board and the ST STM32CubeIDE toolchain.

- [Demo for Nucleo-F767ZI/GCC](#)

Preconfigured programs for the Nucleo-F767ZI board and the GNU ARM GCC compiler.

- [Demo for Nucleo-F767ZI/IAR](#)

Preconfigured programs for the Nucleo-F767ZI board and the IAR Embedded Workbench IDE.

- [Demo for Nucleo-F767ZI/Keil](#)

Preconfigured programs for the Nucleo-F767ZI board and the Keil MDK toolchain.

- [Demo for Nucleo-H743ZI/STM32CubeIDE](#)

Preconfigured programs for the Nucleo-H743ZI board and the ST STM32CubeIDE toolchain.

- [Demo for Nucleo-H743ZI/GCC](#)

Preconfigured programs for the Nucleo-H743ZI board and the GNU ARM GCC compiler.

- [Demo for Nucleo-H743ZI/IAR](#)

Preconfigured programs for the Nucleo-H743ZI board and the IAR Embedded Workbench IDE.

- [Demo for Nucleo-H743ZI/Keil](#)

Preconfigured programs for the Nucleo-H743ZI board and the Keil MDK for ARM IDE.

- [Demo for NXP DevKit-S12G128/CodeWarrior](#)

Preconfigured programs for the NXP DevKit-S12G128 and the CodeWarrior IDE.

- [Demo for Dragon12-plus/CodeWarrior](#)

Preconfigured programs for the EVBplus Dragon12-plus and the CodeWarrior IDE.

5.253.1 Detailed Description

Preconfigured demo programs.

Each demo consists of a bootloader and user program. The bootloader can be tested by performing a firmware update using the supplied user program. Refer to <https://www.feaser.com/openblt/doku.php?id=manual:demos> for an overview of all available demo programs.

The easiest way to get started with the bootloader is by obtaining a low cost development board with on-chip debugger, for which a demo is available. For example one of the ST STM32 Nucleo boards. Getting to know that bootloader and how it works is much easier once you have it running. Then porting it to your own microcontroller system will go smoother. If you'd like assistance or outsource the integration of the bootloader on your system, feel free to contact Feaser (<http://www.feaser.com>).

5.254 Bootloader

Bootloader.

5.259.1 Detailed Description

User Program.

The intention of the demo user program is two-fold. (1) To test the bootloader, you need some sort of firmware to see if you can perform a firmware update with the bootloader. This program can be used for this purpose. (2) To make firmware programmable by the bootloader, a few adjustments to the firmware are required. The demo user program serves as an example for how these adjustments can be implemented. Additional details on this subject can be found in the port specifics documentation, which is available at: <https://www.feaser.com/openblt/doku.php?id=manual:ports:hcs12>.

5.260 CAN driver of a port

This module implements the CAN driver of a microcontroller port.

Files

- file [_template/can.c](#)
Bootloader CAN communication interface source file.

5.260.1 Detailed Description

This module implements the CAN driver of a microcontroller port.

For the most parts, this driver is already implemented. The only parts that need porting are the CAN initialization, CAN message reception and CAN message transmission.

5.261 CPU driver of a port

This module implements the CPU driver of a microcontroller port.

Files

- file [_template/cpu.c](#)
Bootloader cpu module source file.

5.261.1 Detailed Description

This module implements the CPU driver of a microcontroller port.

5.262 Flash driver of a port

This module implements the flash EEPROM memory driver of a microcontroller port.

Files

- file [_template/flash.c](#)
Bootloader flash driver source file.
- file [_template/flash.h](#)
Bootloader flash driver header file.

5.262.1 Detailed Description

This module implements the flash EEPROM memory driver of a microcontroller port.

The flash driver manages the actual erase and program operations on the flash EEPROM and the signature checksum. The signature checksum is a 32-bit value in the user program. It is used as a flag to determine if a user program is present or not. Newly programmed data is always first buffered in RAM buffers with a size of FLASH_WRITE_BLOCK_SIZE. This driver manages a second RAM buffer of the same size, called the bootBlock. The bootBlock buffers program data that includes the interrupt vector table and the 32-bit signature checksum. The signature checksum value is written as the last step during a firmware update, hence the need for the bootBlock. Note that the majority of this flash driver can be used as is. The only parts that need to be updated / implemented are:

- Macros FLASH_WRITE_BLOCK_SIZE and BOOT_FLASH_VECTOR_TABLE_CS_OFFSET.
- The flashLayout[]-array contents.
- The functions [FlashEraseSectors\(\)](#) and [FlashWriteBlock\(\)](#).
- The functions [FlashWriteChecksum\(\)](#) and [FlashVerifyChecksum\(\)](#).

5.263 Compiler specifics of a port

This module implements the compiler specific parts of a microcontroller port.

Files

- file [_template/GCC/cpu_comp.c](#)
Bootloader cpu module source file.

5.263.1 Detailed Description

This module implements the compiler specific parts of a microcontroller port.

5.264 Non-volatile memory driver of a port

This module implements the non-volatile memory driver of a microcontroller port. Note that the default implementation is for a microcontroller that has internal flash memory. At the time of this writing pretty much all microcontrollers use flash EEPROM as non-volatile memory to store the program code. Assuming that this is also the case for the microcontroller for which the port is developed, nothing needs to be modified in this source file.

Files

- file [_template/nvm.c](#)

Bootloader non-volatile memory driver source file.

5.264.1 Detailed Description

This module implements the non-volatile memory driver of a microcontroller port. Note that the default implementation is for a microcontroller that has internal flash memory. At the time of this writing pretty much all microcontrollers use flash EEPROM as non-volatile memory to store the program code. Assuming that this is also the case for the microcontroller for which the port is developed, nothing needs to be modified in this source file.

5.265 RS232 UART driver of a port

This module implements the RS232 UART driver of a microcontroller port.

Files

- file [_template/rs232.c](#)
Bootloader RS232 communication interface source file.

5.265.1 Detailed Description

This module implements the RS232 UART driver of a microcontroller port.

For the most parts, this driver is already implemented. The only parts that need porting are the UART initialization, byte reception and byte transmission.

5.266 Target Port Template

Target dependent code as a template for new microcontroller ports.

Modules

- [CAN driver of a port](#)
This module implements the CAN driver of a microcontroller port.
- [CPU driver of a port](#)
This module implements the CPU driver of a microcontroller port.
- [Flash driver of a port](#)
This module implements the flash EEPROM memory driver of a microcontroller port.
- [Compiler specifics of a port](#)
This module implements the compiler specific parts of a microcontroller port.
- [Non-volatile memory driver of a port](#)
This module implements the non-volatile memory driver of a microcontroller port. Note that the default implementation is for a microcontroller that has internal flash memory. At the time of this writing pretty much all microcontrollers use flash EEPROM as non-volatile memory to store the program code. Assuming that this is also the case for the microcontroller for which the port is developed, nothing needs to be modified in this source file.
- [RS232 UART driver of a port](#)
This module implements the RS232 UART driver of a microcontroller port.
- [Timer driver of a port](#)
This module implements the timer memory driver of a microcontroller port.
- [Type definitions of a port](#)
This module implements the variable type definitions of a microcontroller port.
- [USB driver of a port](#)
This module implements the USB driver of a microcontroller port.

5.266.1 Detailed Description

Target dependent code as a template for new microcontroller ports.

This module serves as a template to implement the bootloader's target dependent part for a specific microcontroller family. It can be copied and used as a foundation when developing new microcontroller ports. Note that the parts of a port that need to be implemented are described as a source code comment that starts with "TODO ##Port".

5.267 Timer driver of a port

This module implements the timer memory driver of a microcontroller port.

Files

- file [Source/_template/timer.c](#)
Bootloader timer driver source file.

5.267.1 Detailed Description

This module implements the timer memory driver of a microcontroller port.

The timer driver implements a polling based 1 millisecond timer. It provides the time base for all timing related parts of the bootloader. The bootloader calls the function [TimerUpdate\(\)](#) continuously to check if the next millisecond period passed.

5.268 Type definitions of a port

This module implements the variable type definitions of a microcontroller port.

Files

- file [_template/types.h](#)
Bootloader types header file.

5.268.1 Detailed Description

This module implements the variable type definitions of a microcontroller port.

5.269 USB driver of a port

This module implements the USB driver of a microcontroller port.

Files

- file [_template/usb.c](#)
Bootloader USB communication interface source file.

5.269.1 Detailed Description

This module implements the USB driver of a microcontroller port.

The USB driver makes user of bulk communications only, by means of two endpoints. This driver already implements FIFO buffers for the endpoint data including utility functions for managing these FIFOs. Note that the USB descriptor configuration and other enumeration related configuration is typically stored with the bootloader demo application and is not implemented in this driver directly. Basically, whenever the USB communication stack is available to transmit new data on the IN-endpoint, function [UsbTransmitPipeBulkIN\(\)](#) can be called, which checks if there is data to transmit in the FIFO buffer and then needs to copy it to the IN-endpoint buffer. Whenever the USB communication stack signals that new data was received on the OUT-endpoint, [UsbReceivePipeBulkOUT\(\)](#) can be called which then copies the data from the OUT-endpoint buffer into the FIFO buffer.

5.270 Target ARMCM0 S32K11

Target dependent code for the NXP ARMCM0 S32K11x microcontroller family.

Files

- file [ARMCM0_S32K11/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM0_S32K11/cpu.c](#)
Bootloader cpu module source file.

Bootloader timer driver source file.
- file [ARMCM0_S32K11/types.h](#)
Bootloader types header file.

5.270.1 Detailed Description

Target dependent code for the NXP ARMCM0 S32K11x microcontroller family.

This module implements the bootloader's target dependent part for the NXP ARMCM0 S32K11x microcontroller family.

5.271 Target ARMCM0 STM32F0

Target dependent code for the ARMCM0 STM32F0 microcontroller family.

Files

- file [ARMCM0_STM32F0/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM0_STM32F0/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM0_STM32F0/flash.c](#)
Bootloader flash driver source file.

Bootloader cpu module source file.
- file [ARMCM33_STM32L5/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM33_STM32L5/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM33_STM32L5/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM33_STM32L5/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM33_STM32L5/types.h](#)
Bootloader types header file.
- file [ARMCM33_STM32L5/usb.c](#)
Bootloader USB communication interface source file.

5.274.1 Detailed Description

Target dependent code for the ARMCM33 STM32L5 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM33 STM32L5 microcontroller family.

5.275 Target ARMCM3 EFM32

Target dependent code for the ARMCM3 EFM32 microcontroller family.

Files

- file [ARMCM3_EFM32/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM3_EFM32/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM3_EFM32/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM3_EFM32/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_EFM32/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_EFM32/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM3_EFM32/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM3_EFM32/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM3_EFM32/types.h](#)
Bootloader types header file.

5.275.1 Detailed Description

Target dependent code for the ARMCM3 EFM32 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM3 EFM32 microcontroller family.

5.276 Target ARMCM3 LM3S

Target dependent code for the ARMCM3 LM3S microcontroller family.

Files

- file [ARMCM3_LM3S/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM3_LM3S/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM3_LM3S/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM3_LM3S/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM3_LM3S/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_LM3S/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_LM3S/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM3_LM3S/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM3_LM3S/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM3_LM3S/types.h](#)
Bootloader types header file.

5.276.1 Detailed Description

Target dependent code for the ARMCM3 LM3S microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM3 LM3S microcontroller family.

5.277 Target ARMCM3 STM32F1

Target dependent code for the ARMCM3 STM32F1 microcontroller family.

Files

- file [ARMCM3_STM32F1/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM3_STM32F1/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F1/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM3_STM32F1/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM3_STM32F1/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F1/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F1/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F1/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM3_STM32F1/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM3_STM32F1/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM3_STM32F1/types.h](#)
Bootloader types header file.
- file [ARMCM3_STM32F1/usb.c](#)
Bootloader USB communication interface source file.

5.277.1 Detailed Description

Target dependent code for the ARMCM3 STM32F1 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM3 STM32F1 microcontroller family.

5.278 Target ARMCM3 STM32F2

Target dependent code for the ARMCM3 STM32F2xx microcontroller family.

Files

- file [ARMCM3_STM32F2/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM3_STM32F2/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F2/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM3_STM32F2/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM3_STM32F2/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F2/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F2/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM3_STM32F2/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM3_STM32F2/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM3_STM32F2/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM3_STM32F2/types.h](#)
Bootloader types header file.

5.278.1 Detailed Description

Target dependent code for the ARMCM3 STM32F2xx microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM3 STM32F2xx microcontroller family.

5.279 Target ARMCM4 S32K14

Target dependent code for the NXP ARMCM4 S32K14x microcontroller family.

Files

- file [ARMCM4_S32K14/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM4_S32K14/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM4_S32K14/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM4_S32K14/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM4_S32K14/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_S32K14/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_S32K14/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [Source/ARMCM4_S32K14/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM4_S32K14/types.h](#)
Bootloader types header file.

5.279.1 Detailed Description

Target dependent code for the NXP ARMCM4 S32K14x microcontroller family.

This module implements the bootloader's target dependent part for the NXP ARMCM4 S32K14x microcontroller family.

5.280 Target ARMCM4 STM32F3

Target dependent code for the ARMCM4 STM32F3 microcontroller family.

Files

- file [ARMCM4_STM32F3/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM4_STM32F3/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F3/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM4_STM32F3/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM4_STM32F3/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F3/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F3/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F3/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM4_STM32F3/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM4_STM32F3/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM4_STM32F3/types.h](#)
Bootloader types header file.
- file [ARMCM4_STM32F3/usb.c](#)
Bootloader USB communication interface source file.

5.280.1 Detailed Description

Target dependent code for the ARMCM4 STM32F3 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM4 STM32F3 microcontroller family.

5.281 Target ARMCM4 STM32F4

Target dependent code for the ARMCM4 STM32F4 microcontroller family.

Files

- file [ARMCM4_STM32F4/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM4_STM32F4/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F4/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM4_STM32F4/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM4_STM32F4/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F4/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F4/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32F4/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM4_STM32F4/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM4_STM32F4/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM4_STM32F4/types.h](#)
Bootloader types header file.
- file [ARMCM4_STM32F4/usb.c](#)
Bootloader USB communication interface source file.

5.281.1 Detailed Description

Target dependent code for the ARMCM4 STM32F4 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM4 STM32F4 microcontroller family.

5.282 Target ARMCM4 STM32L4

Target dependent code for the ARMCM4 STM32L4 microcontroller family.

Files

- file [ARMCM4_STM32L4/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM4_STM32L4/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32L4/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM4_STM32L4/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM4_STM32L4/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32L4/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32L4/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_STM32L4/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM4_STM32L4/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM4_STM32L4/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM4_STM32L4/types.h](#)
Bootloader types header file.

5.282.1 Detailed Description

Target dependent code for the ARMCM4 STM32L4 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM4 STM32L4 microcontroller family.

5.283 Target ARMCM4 TM4C

Target dependent code for the ARMCM4 TM4C microcontroller family.

Files

- file [ARMCM4_TM4C/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM4_TM4C/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM4_TM4C/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM4_TM4C/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_TM4C/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM4_TM4C/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM4_TM4C/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM4_TM4C/types.h](#)
Bootloader types header file.
- file [ARMCM4_TM4C/usb.c](#)
Bootloader USB communication interface source file.

5.283.1 Detailed Description

Target dependent code for the ARMCM4 TM4C microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM4 TM4C microcontroller family.

5.284 Target ARMCM4 XMC4

Target dependent code for the ARMCM4 XMC4xxx microcontroller family.

Files

- file [ARMCM4_XMC4/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM4_XMC4/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM4_XMC4/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM4_XMC4/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM4_XMC4/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_XMC4/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM4_XMC4/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM4_XMC4/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM4_XMC4/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM4_XMC4/types.h](#)
Bootloader types header file.

5.284.1 Detailed Description

Target dependent code for the ARMCM4 XMC4xxx microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM4 XMC4xxx microcontroller family.

5.285 Target ARMCM7 STM32F7

Target dependent code for the ARMCM7 STM32F7 microcontroller family.

Files

- file [ARMCM7_STM32F7/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM7_STM32F7/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32F7/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM7_STM32F7/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM7_STM32F7/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32F7/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32F7/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32F7/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM7_STM32F7/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM7_STM32F7/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM7_STM32F7/types.h](#)
Bootloader types header file.
- file [ARMCM7_STM32F7/usb.c](#)
Bootloader USB communication interface source file.

5.285.1 Detailed Description

Target dependent code for the ARMCM7 STM32F7 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM7 STM32F7 microcontroller family.

5.286 Target ARMCM7 STM32H7

Target dependent code for the ARMCM7 STM32H7 microcontroller family.

Files

- file [ARMCM7_STM32H7/can.c](#)
Bootloader CAN communication interface source file.
- file [ARMCM7_STM32H7/cpu.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32H7/flash.c](#)
Bootloader flash driver source file.
- file [ARMCM7_STM32H7/flash.h](#)
Bootloader flash driver header file.
- file [ARMCM7_STM32H7/GCC/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32H7/IAR/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32H7/Keil/cpu_comp.c](#)
Bootloader cpu module source file.
- file [ARMCM7_STM32H7/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [ARMCM7_STM32H7/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/ARMCM7_STM32H7/timer.c](#)
Bootloader timer driver source file.
- file [ARMCM7_STM32H7/types.h](#)
Bootloader types header file.
- file [ARMCM7_STM32H7/usb.c](#)
Bootloader USB communication interface source file.

5.286.1 Detailed Description

Target dependent code for the ARMCM7 STM32H7 microcontroller family.

This module implements the bootloader's target dependent part for the ARMCM7 STM32H7 microcontroller family.

5.287 Bootloader Core

Target independent code.

Files

- file [asserts.c](#)
Bootloader assertion module source file.
- file [asserts.h](#)
Bootloader assertion module header file.
- file [backdoor.c](#)
Bootloader backdoor entry source file.
- file [backdoor.h](#)
Bootloader backdoor entry header file.
- file [Source/boot.c](#)
Bootloader core module source file.
- file [Source/boot.h](#)
Bootloader core module header file.
- file [can.h](#)
Bootloader CAN communication interface header file.
- file [com.c](#)
Bootloader communication interface source file.
- file [com.h](#)
Bootloader communication interface header file.
- file [cop.c](#)
Bootloader watchdog module source file.
- file [cop.h](#)
Bootloader watchdog module header file.
- file [cpu.h](#)
Bootloader cpu module header file.
- file [file.c](#)
Bootloader file system interface source file.
- file [file.h](#)
Bootloader file system interface header file.
- file [Source/net.c](#)
Bootloader TCP/IP network communication interface source file.
- file [Source/net.h](#)
Bootloader TCP/IP network communication interface header file.
- file [nvm.h](#)
Bootloader non-volatile memory driver header file.
- file [plausibility.h](#)
Bootloader plausibility check header file, for checking the configuration at compile time.
- file [rs232.h](#)
Bootloader RS232 communication interface header file.
- file [Source/timer.h](#)
Bootloader timer driver header file.
- file [usb.h](#)
Bootloader USB communication interface header file.
- file [xcp.c](#)
XCP 1.0 protocol core source file.
- file [xcp.h](#)
XCP 1.0 protocol core header file.

5.287.1 Detailed Description

Target independent code.

The bootloader core contains the main functionality of the bootloader, independent of the microcontroller/compiler and independent of your specific application. There is generally no need for you to make changes here, unless you are adding new functionality such as the support for a new communication interface or a different communication protocol.

By default the XCP version 1.0 is used as the communication transport layer for remote firmware updates, for example via UART or CAN. Its official name is ASAM MCD-1 XCP V1.0.0 and it is a universal measurement and calibration protocol that defines a bus-independent, master-slave communication protocol to connect ECU's with calibration systems. More information can be found at <http://www.asam.net/>.

For local firmware updates, for example from a locally attached SD-card, the FATFS file system is used as a target independent interface to access files. More information can be found at http://elm-chan.org/fsw/ff/00index_e.html

5.288 Target HCS12

Target dependent code for the Freescale HCS12 microcontroller family.

Files

- file [HCS12/can.c](#)
Bootloader CAN communication interface source file.
- file [HCS12/CodeWarrior/cpu_comp.c](#)
Bootloader cpu module source file.
- file [HCS12/cpu.c](#)
Bootloader cpu module source file.
- file [HCS12/flash.c](#)
Bootloader flash driver source file.
- file [HCS12/flash.h](#)
Bootloader flash driver header file.
- file [flash_ecc.c](#)
Bootloader flash driver source file for HCS12 derivatives with error correction code in flash memory, such as the HCS12Pxx. This flash memory uses a different addressing scheme than other HCS12 derivatives.
- file [HCS12/nvm.c](#)
Bootloader non-volatile memory driver source file.
- file [HCS12/rs232.c](#)
Bootloader RS232 communication interface source file.
- file [Source/HCS12/timer.c](#)
Bootloader timer driver source file.
- file [HCS12/types.h](#)
Bootloader types header file.

5.288.1 Detailed Description

Target dependent code for the Freescale HCS12 microcontroller family.

This module implements the bootloader's target dependent part for the Freescale HCS12 microcontroller family.

5.289 Bootloader Ports

Target dependent code.

Modules

- [Target Port Template](#)
Target dependent code as a template for new microcontroller ports.
- [Target ARMCM0 S32K11](#)
Target dependent code for the NXP ARMCM0 S32K11x microcontroller family.
- [Target ARMCM0 STM32F0](#)
Target dependent code for the ARMCM0 STM32F0 microcontroller family.
- [Target ARMCM0 STM32G0](#)
Target dependent code for the ARMCM0 STM32G0 microcontroller family.
- [Target ARMCM0 XMC1](#)
Target dependent code for the ARMCM0 XMC1xxx microcontroller family.
- [Target ARMCM33 STM32L5](#)
Target dependent code for the ARMCM33 STM32L5 microcontroller family.
- [Target ARMCM3 EFM32](#)
Target dependent code for the ARMCM3 EFM32 microcontroller family.
- [Target ARMCM3 LM3S](#)
Target dependent code for the ARMCM3 LM3S microcontroller family.
- [Target ARMCM3 STM32F1](#)
Target dependent code for the ARMCM3 STM32F1 microcontroller family.
- [Target ARMCM3 STM32F2](#)
Target dependent code for the ARMCM3 STM32F2xx microcontroller family.
- [Target ARMCM4 S32K14](#)
Target dependent code for the NXP ARMCM4 S32K14x microcontroller family.
- [Target ARMCM4 STM32F3](#)
Target dependent code for the ARMCM4 STM32F3 microcontroller family.
- [Target ARMCM4 STM32F4](#)
Target dependent code for the ARMCM4 STM32F4 microcontroller family.
- [Target ARMCM4 STM32L4](#)
Target dependent code for the ARMCM4 STM32L4 microcontroller family.
- [Target ARMCM4 TM4C](#)
Target dependent code for the ARMCM4 TM4C microcontroller family.
- [Target ARMCM4 XMC4](#)
Target dependent code for the ARMCM4 XMC4xxx microcontroller family.
- [Target ARMCM7 STM32F7](#)
Target dependent code for the ARMCM7 STM32F7 microcontroller family.
- [Target ARMCM7 STM32H7](#)
Target dependent code for the ARMCM7 STM32H7 microcontroller family.
- [Target HCS12](#)
Target dependent code for the Freescale HCS12 microcontroller family.

5.289.1 Detailed Description

Target dependent code.

The bootloader targets contain the microcontroller and compiler dependent parts of the bootloader. They are grouped per microcontroller family. This is the part that needs to be newly developed when porting the bootloader to a new microcontroller family.

Chapter 6

Data Structure Documentation

6.1 tCanBusTiming Struct Reference

Structure type for grouping CAN bus timing related information.

Data Fields

- unsigned char [timeQuanta](#)
- unsigned char [propSeg](#)
- unsigned char [phaseSeg1](#)
- unsigned char [phaseSeg2](#)
- unsigned char [tseg1](#)
- unsigned char [tseg2](#)
- [blt_int8u](#) [tseg1](#)
- [blt_int8u](#) [tseg2](#)
- [blt_int8u](#) [timeQuanta](#)
- [blt_int8u](#) [propSeg](#)
- [blt_int8u](#) [phaseSeg1](#)
- [blt_int8u](#) [phaseSeg2](#)

6.1.1 Detailed Description

Structure type for grouping CAN bus timing related information.

Structure type with the layout of the CAN bus timing registers.

6.1.2 Field Documentation

6.1.2.1 [phaseSeg1](#) [1/2]

[blt_int8u](#) [phaseSeg1](#)

CAN phase segment 1

6.1.2.2 phaseSeg1 [2/2]

`blt_int8u` phaseSeg1

CAN phase segment 1

Referenced by BootComCanInit(), and CanInit().

6.1.2.3 phaseSeg2 [1/2]

`blt_int8u` phaseSeg2

CAN phase segment 2

6.1.2.4 phaseSeg2 [2/2]

`blt_int8u` phaseSeg2

CAN phase segment 2

Referenced by BootComCanInit(), and CanInit().

6.1.2.5 propSeg [1/2]

`blt_int8u` propSeg

CAN propagation segment

6.1.2.6 propSeg [2/2]

`blt_int8u` propSeg

CAN propagation segment

Referenced by BootComCanInit(), and CanInit().

6.1.2.7 timeQuanta [1/2]

`blt_int8u` timeQuanta

Total number of time quanta

6.1.2.8 timeQuanta [2/2]

`blt_int8u` timeQuanta

Total number of time quanta

Referenced by `CanGetSpeedConfig()`.

6.1.2.9 tseg1 [1/2]

`blt_int8u` tseg1

CAN time segment 1

6.1.2.10 tseg1 [2/2]

`blt_int8u` tseg1

CAN time segment 1

Referenced by `CanGetSpeedConfig()`.

6.1.2.11 tseg2 [1/2]

`blt_int8u` tseg2

CAN time segment 2

6.1.2.12 tseg2 [2/2]

`blt_int8u` tseg2

CAN time segment 2

Referenced by `CanGetSpeedConfig()`.

The documentation for this struct was generated from the following files:

- `Demo/ARMCM0_S32K11_S32K118EVB_GCC/Prog/boot.c`
- [_template/can.c](#)

6.2 tCanRegs Struct Reference

Structure type with the layout of the CAN related control registers.

Collaboration diagram for tCanRegs:

Data Fields

- volatile `blt_int8u cctl0`
- volatile `blt_int8u cctl1`
- volatile `blt_int8u cbtr0`
- volatile `blt_int8u cbtr1`
- volatile `blt_int8u crflg`
- volatile `blt_int8u crier`
- volatile `blt_int8u ctflg`
- volatile `blt_int8u ctier`
- volatile `blt_int8u ctarq`
- volatile `blt_int8u ctaak`
- volatile `blt_int8u ctbsel`
- volatile `blt_int8u cidac`
- volatile `blt_int8u dummy1` [2]
- volatile `blt_int8u cxerr`
- volatile `blt_int8u ctxerr`
- volatile `blt_int8u cidar0`
- volatile `blt_int8u cidar1`
- volatile `blt_int8u cidar2`
- volatile `blt_int8u cidar3`
- volatile `blt_int8u cidmr0`
- volatile `blt_int8u cidmr1`
- volatile `blt_int8u cidmr2`
- volatile `blt_int8u cidmr3`
- volatile `blt_int8u cidar4`

6.2.1 Detailed Description

Structure type with the layout of the CAN related control registers.

6.2.2 Field Documentation

6.2.2.1 cbtr0

```
volatile blt_int8u cbtr0
```

bus timing register 0

6.2.2.2 cbtr1

```
volatile blt_int8u cbtr1
```

bus timing register 1

6.2.2.3 cctl0

```
volatile blt_int8u cctl0
```

control register 0

6.2.2.4 cctl1

```
volatile blt_int8u cctl1
```

control register 1

6.2.2.5 cidac

```
volatile blt_int8u cidac
```

identifier acceptance control register

6.2.2.6 cidar0

```
volatile blt_int8u cidar0
```

identifier acceptance register 0

6.2.2.7 cidar1

volatile `blt_int8u` cidar1

identifier acceptance register 1

6.2.2.8 cidar2

volatile `blt_int8u` cidar2

identifier acceptance register 2

6.2.2.9 cidar3

volatile `blt_int8u` cidar3

identifier acceptance register 3

6.2.2.10 cidar4

volatile `blt_int8u` cidar4

identifier acceptance register 4

6.2.2.11 cidar5

volatile `blt_int8u` cidar5

identifier acceptance register 5

6.2.2.12 cidar6

volatile `blt_int8u` cidar6

identifier acceptance register 6

6.2.2.13 cidar7

volatile `blt_int8u` cidar7

identifier acceptance register 7

6.2.2.14 cidmr0

volatile `blt_int8u` cidmr0

identifier mask register 0

6.2.2.15 cidmr1

volatile `blt_int8u` cidmr1

identifier mask register 1

6.2.2.16 cidmr2

volatile `blt_int8u` cidmr2

identifier mask register 2

6.2.2.17 cidmr3

volatile `blt_int8u` cidmr3

identifier mask register 3

6.2.2.18 cidmr4

volatile `blt_int8u` cidmr4

identifier mask register 4

6.2.2.19 cidmr5

volatile `blt_int8u` cidmr5

identifier mask register 5

6.2.2.20 cidmr6

volatile `blt_int8u` cidmr6

identifier mask register 6

6.2.2.21 cidmr7

volatile `blt_int8u` cidmr7

identifier mask register 7

6.2.2.22 crflg

volatile `blt_int8u` crflg

receiver flag register

6.2.2.23 crier

volatile `blt_int8u` crier

receiver interrupt enable register

6.2.2.24 crxerr

volatile `blt_int8u` crxerr

receive error counter

6.2.2.25 ctaak

volatile `blt_int8u` ctaak

transmitter message abort control

6.2.2.26 ctarq

volatile `blt_int8u` ctarq

transmitter message abort control

6.2.2.27 ctbsel

volatile `blt_int8u` ctbsel

transmit buffer selection

6.2.2.28 ctflg

volatile `blt_int8u` ctflg

transmitter flag register

6.2.2.29 ctier

volatile `blt_int8u` ctier

transmitter interrupt enable register

6.2.2.30 ctxerr

volatile `blt_int8u` ctxerr

transmit error counter

6.2.2.31 dummy1

```
volatile blt_int8u dummy1[2]
```

reserved (2)

6.2.2.32 rxSlot

```
volatile tCanRxMsgSlot rxSlot
```

foreground receive message slot

6.2.2.33 txSlot

```
volatile tCanTxMsgSlot txSlot
```

foreground transmit message slot

The documentation for this struct was generated from the following file:

- [HCS12/can.c](#)

6.3 tCanRxMsgSlot Struct Reference

Structure type with the layout of a CAN reception message slot.

Data Fields

- volatile [blt_int8u](#) [idr](#) [4]
- volatile [blt_int8u](#) [dsr](#) [8]
- volatile [blt_int8u](#) [dlr](#)
- volatile [blt_int8u](#) [dummy](#)
- volatile [blt_int16u](#) [tstamp](#)

6.3.1 Detailed Description

Structure type with the layout of a CAN reception message slot.

6.3.2 Field Documentation

6.3.2.1 dlr

```
volatile blt_int8u dlr
```

data length register

6.3.2.2 dsr

```
volatile blt_int8u dsr[8]

6.5 tFatFsObjects Struct Reference

Structure type for grouping FATFS related objects used by this module.

Data Fields

- FATFS [fs](#)
- FIL [file](#)

6.5.1 Detailed Description

Structure type for grouping FATFS related objects used by this module.

6.5.2 Field Documentation

6.5.2.1 file

FIL [file](#)

file object for firmware file

Referenced by FileTask().

6.5.2.2 fs

FATFS [fs](#)

file system object for mouting

Referenced by FileInit().

The documentation for this struct was generated from the following file:

- [file.c](#)

6.6 tFifoCtrl Struct Reference

Structure type for fifo control.

Data Fields

- [blt_int8u](#) * [startptr](#)
- [blt_int8u](#) * [endptr](#)
- [blt_int8u](#) * [readptr](#)
- [blt_int8u](#) * [writeptr](#)
- [blt_int8u](#) [length](#)
- [blt_int8u](#) [entries](#)
- [blt_int8u](#) [handle](#)
- struct t_fifo_ctrl * [fifoctrlptr](#)

6.6.1 Detailed Description

Structure type for fifo control.

6.6.2 Field Documentation

6.6.2.1 endptr

```
blt_int8u * endptr
```

pointer to end of buffer

Referenced by UsbFifoMgrCreate().

6.6.2.2 entries

```
blt_int8u entries
```

of full buffer elements

Referenced by UsbFifoMgrCreate(), UsbFifoMgrRead(), UsbFifoMgrScan(), and UsbFifoMgrWrite().

6.6.2.3 fifoctrlptr

```
struct t_fifo_ctrl * fifoctrlptr
```

pointer to free buffer control

Referenced by UsbFifoMgrCreate(), and UsbFifoMgrInit().

6.6.2.4 handle

```
blt_int8u handle
```

handle of the buffer

Referenced by UsbFifoMgrCreate(), and UsbFifoMgrInit().

6.6.2.5 length

`blt_int8u` length

number of buffer elements

Referenced by `UsbFifoMgrCreate()`.

6.6.2.6 readptr

`blt_int8u *` readptr

pointer to next read location

Referenced by `UsbFifoMgrCreate()`, and `UsbFifoMgrRead()`.

6.6.2.7 startptr

`blt_int8u *` startptr

pointer to start of buffer

Referenced by `UsbFifoMgrCreate()`, `UsbFifoMgrRead()`, and `UsbFifoMgrWrite()`.

6.6.2.8 writeptr

`blt_int8u *` writeptr

pointer to next free location

Referenced by `UsbFifoMgrCreate()`, and `UsbFifoMgrWrite()`.

The documentation for this struct was generated from the following file:

- [_template/usb.c](#)

6.7 tFifoPipe Struct Reference

Structure type for a fifo pipe.

Data Fields

- [blt_int8u handle](#)
- [blt_int8u data](#) [[FIFO_PIPE_SIZE](#)]

6.7.1 Detailed Description

Structure type for a fifo pipe.

6.7.2 Field Documentation

6.7.2.1 data

[blt_int8u](#) data

fifo data buffer

Referenced by [UsbInit\(\)](#).

6.7.2.2 handle

[blt_int8u](#) handle

fifo handle

Referenced by [UsbInit\(\)](#), [UsbReceiveByte\(\)](#), [UsbReceivePipeBulkOUT\(\)](#), [UsbTransmitByte\(\)](#), and [UsbTransmitPipeBulkIN\(\)](#).

The documentation for this struct was generated from the following file:

- [_template/usb.c](#)

6.8 tFileEraseInfo Struct Reference

Structure type with information for the memory erase opeartion.

Data Fields

- [blt_addr](#) start_address
- [blt_int32u](#) total_size

6.8.1 Detailed Description

Structure type with information for the memory erase operation.

6.8.2 Field Documentation

6.8.2.1 start_address

`blt_addr start_address`

erase start address

Referenced by FileTask().

6.8.2.2 total_size

`blt_int32u total_size`

total number of bytes to erase

Referenced by FileTask().

The documentation for this struct was generated from the following file:

- [file.c](#)

6.9 tFlashBlockInfo Struct Reference

Structure type for grouping flash block information.

6.9.1 Detailed Description

Structure type for grouping flash block information.

Programming is done per block of max FLASH_WRITE_BLOCK_SIZE. for this a flash block manager is implemented in this driver. this flash block manager depends on this flash block info structure. It holds the base address of the flash block and the data that should be programmed into the flash block. The .base_addr must be a multiple of FLASH_WRITE_BLOCK_SIZE.

The documentation for this struct was generated from the following files:

- [_template/flash.c](#)
- [flash_ecc.c](#)

6.10 tFlashPrescalerSysclockMapping Struct Reference

Mapping table for finding the corect flash clock divider prescaler.

Data Fields

- [blt_int16u sysclock_min](#)
- [blt_int16u sysclock_max](#)
- [blt_int8u prescaler](#)

6.10.1 Detailed Description

Mapping table for finding the corect flash clock divider prescaler.

6.10.2 Field Documentation

6.10.2.1 prescaler

[blt_int8u](#) prescaler

prescaler for this busclock range

Referenced by `FlashInit()`.

6.10.2.2 sysclock_max

[blt_int16u](#) sysclock_max

max busclock for this prescaler

Referenced by `FlashInit()`.

6.10.2.3 sysclock_min

[blt_int16u](#) sysclock_min

min busclock for this prescaler

The documentation for this struct was generated from the following file:

- [flash_ecc.c](#)

6.11 tFlashRegs Struct Reference

Structure type for the flash control registers.

Data Fields

- volatile `blt_int8u` `fcldiv`
- volatile `blt_int8u` `fsec`
- volatile `blt_int8u` `ftstmod`
- volatile `blt_int8u` `fcnfg`
- volatile `blt_int8u` `fprot`
- volatile `blt_int8u` `fstat`
- volatile `blt_int8u` `fcmd`
- volatile `blt_int8u` `fccobix`
- volatile `blt_int8u` `frsv0`
- volatile `blt_int8u` `fercnfg`
- volatile `blt_int8u` `ferstat`
- volatile `blt_int8u` `dfprot`
- volatile `blt_int16u` `fccob`
- volatile `blt_int8u` `frsv1`
- volatile `blt_int8u` `frsv2`
- volatile `blt_int8u` `frsv3`
- volatile `blt_int8u` `frsv4`
- volatile `blt_int8u` `fopt`
- volatile `blt_int8u` `frsv5`
- volatile `blt_int8u` `frsv6`
- volatile `blt_int8u` `frsv7`

6.11.1 Detailed Description

Structure type for the flash control registers.

6.11.2 Field Documentation

6.11.2.1 dfprot

```
volatile blt_int8u dfprot
```

data flash protection register

6.11.2.2 fccob

```
volatile blt_int16u fccob
```

flash command common object reg.

6.11.2.3 fccobix

volatile `blt_int8u` fccobix

flash CCOB index register

6.11.2.4 fclkdiv

volatile `blt_int8u` fclkdiv

flash clock divider register

6.11.2.5 fcmd

volatile `blt_int8u` fcmd

flash command register

6.11.2.6 fcncfg

volatile `blt_int8u` fcncfg

flash configuration register

6.11.2.7 fercnfg

volatile `blt_int8u` fercnfg

flash error configuration reg.

6.11.2.8 ferstat

volatile `blt_int8u` ferstat

flash error status register

6.11.2.9 fopt

volatile `blt_int8u` fopt

flash option register

6.11.2.10 fprot

```
volatile blt_int8u fprot
```

flash protection register

program flash protection register

6.11.2.11 frsv0

```
volatile blt_int8u frsv0
```

flash reserver register

6.11.2.12 frsv1

```
volatile blt_int8u frsv1
```

flash reserver register

6.11.2.13 frsv2

```
volatile blt_int8u frsv2
```

flash reserver register

6.11.2.14 frsv3

```

```

flash reserver register

6.11.2.15 frsv4

```
volatile blt_int8u frsv4
```

flash reserver register

6.11.2.16 frsv5

```
volatile blt_int8u frsv5
```

flash reserver register

6.11.2.17 frsv6

```
volatile blt_int8u frsv6
```

flash reserver register

6.11.2.18 frsv7

```
volatile blt_int8u frsv7
```

flash reserver register

6.11.2.19 fsec

```
volatile blt_int8u fsec
```

flash security register

6.11.2.20 fstat

```
volatile blt_int8u fstat
```

flash status register

6.11.2.21 ftstmod

```
volatile blt_int8u ftstmod
```

flash test mode register

The documentation for this struct was generated from the following files:

- [HCS12/flash.c](#)
- [flash_ecc.c](#)

6.12 tFlashSector Struct Reference

Flash sector descriptor type.

Data Fields

- [blt_addr sector_start](#)
- [blt_int32u sector_size](#)
- [blt_int8u sector_num](#)
- [blt_int8u bank_num](#)

6.12.1 Detailed Description

Flash sector descriptor type.

Structure type for the flash sectors in the flash layout table.

Flash sector descriptor type. Note that in this driver the word sector is synonym to the word page, which is used in the HAL driver.

6.12.2 Field Documentation

6.12.2.1 bank_num

```
blt_int8u bank_num
```

bank number

Referenced by FlashEraseSectors().

6.12.2.2 sector_num

```
blt_int8u sector_num
```

sector number

Referenced by FlashEraseSectors(), and FlashGetSector().

6.12.2.3 sector_size

```
blt_int32u sector_size
```

sector size in bytes

Referenced by FlashEraseSectors(), and FlashGetSectorSize().

6.12.2.4 sector_start

`blt_addr` sector_start

sector start address

Referenced by FlashEraseSectors(), FlashGetSectorBaseAddr(), FlashGetUserProgBaseAddress(), and FlashSwitchBlock().

The documentation for this struct was generated from the following files:

- `_template/flash.c`
- `flash_ecc.c`

6.13 tIsrFunc Union Reference

Structure type for vector table entries.

Data Fields

- `void(* func)(void)`
- `blt_int32u ptr`
- unsigned long `ptr`
- `void * ptr`

6.13.1 Detailed Description

Structure type for vector table entries.

6.13.2 Field Documentation

6.13.2.1 func

`void(* func)(void)`

for ISR function pointers

6.13.2.2 ptr [1/3]

`void* ptr`

for stack pointer entry

6.13.2.3 ptr [2/3]

```
void * ptr
```

for stack pointer entry

Referenced by `__attribute__()`.

6.13.2.4 ptr [3/3]

```
unsigned long ptr
```

for stack pointer entry

The documentation for this union was generated from the following file:

- [ARMCM3_EFM32_Olimex_EM32G880F128STK_GCC/Boot/vectors.c](#)

6.14 tSharedParamsBuffer Struct Reference

Layout of the shared parameters RAM buffer.

Data Fields

- `uint32_t identifier`
Fixed buffer identifier to validate that the RAM contains valid shared parameters.
- `uint8_t data [SHARED_PARAMS_CFG_BUFFER_DATA_LEN]`
Array for the actual parameter data.
- `uint16_t checksum`
Checksum value of all the bytes in the buffer, excluding this checksum value of obvious reasons. The checksum is calculated as the Two's complement of the sum of the bytes.

6.14.1 Detailed Description

Layout of the shared parameters RAM buffer.

The documentation for this struct was generated from the following file:

- [ARMCM3_LM3S_EK_LM3S6965_GCC/Boot/shared_params.c](#)

6.15 tSrecLineParseObject Struct Reference

Structure type for grouping the parsing results of an S-record line.

```
#include <file.h>
```

Data Fields

- [blt_char](#) line [MAX_CHARS_PER_LINE]
- [blt_int8u](#) data [MAX_DATA_BYTES_PER_LINE]
- [blt_addr](#) address

6.15.1 Detailed Description

Structure type for grouping the parsing results of an S-record line.

6.15.2 Field Documentation

6.15.2.1 address

[blt_addr](#) address

address on S1, S2 or S3 line

Referenced by `FileTask()`.

6.15.2.2 data

[blt_int8u](#) data [MAX_DATA_BYTES_PER_LINE]

array for S1, S2 or S3 data bytes

Referenced by `FileTask()`.

6.15.2.3 line

[blt_char](#) line [MAX_CHARS_PER_LINE]

string buffer for the line chars

Referenced by `FileTask()`.

The documentation for this struct was generated from the following file:

- [file.h](#)

6.16 tSysTickRegs Struct Reference

Systick registers.

Data Fields

- volatile [blt_int32u CTRL](#)
- volatile [blt_int32u LOAD](#)
- volatile [blt_int32u VAL](#)

6.16.1 Detailed Description

Systick registers.

6.16.2 Field Documentation

6.16.2.1 CTRL

volatile [blt_int32u CTRL](#)

SysTick Control and Status Register

6.16.2.2 LOAD

volatile [blt_int32u LOAD](#)

SysTick Reload Value Register

6.16.2.3 VAL

volatile [blt_int32u VAL](#)

SysTick Current Value Register

The documentation for this struct was generated from the following file:

- [Source/ARMCM0_XMC1/timer.c](#)

6.17 tTimerRegs Struct Reference

Structure type with the layout of the timer related control registers.

Data Fields

- volatile `blt_int8u` `tios`
- volatile `blt_int8u` `cforc`
- volatile `blt_int8u` `oc7m`
- volatile `blt_int8u` `oc7d`
- volatile `blt_int16u` `tcnt`
- volatile `blt_int8u` `tscr1`
- volatile `blt_int8u` `ttov`
- volatile `blt_int8u` `tctl1`
- volatile `blt_int8u` `tctl2`
- volatile `blt_int8u` `tctl3`
- volatile `blt_int8u` `tctl4`
- volatile `blt_int8u` `tie`
- volatile `blt_int8u` `tscr2`
- volatile `blt_int8u` `tflg1`
- volatile `blt_int8u` `tflg2`
- volatile `blt_int16u` `tc` [8]

6.17.1 Detailed Description

Structure type with the layout of the timer related control registers.

6.17.2 Field Documentation

6.17.2.1 `cforc`

```
volatile blt_int8u cforc
```

compare force register

6.17.2.2 `oc7d`

```
volatile blt_int8u oc7d
```

output compare 7 data register

6.17.2.3 `oc7m`

```
volatile blt_int8u oc7m
```

output compare 7 mask register

6.17.2.4 tc

```
volatile blt_int16u tc[8]
```

input capture/output compare register n

6.17.2.5 tcnt

```
volatile blt_int16u tcnt
```

timer counter register

6.17.2.6 tctl1

```
volatile blt_int8u tctl1
```

timer control register 1

6.17.2.7 tctl2

```
volatile blt_int8u tctl2
```

timer control register 2

6.17.2.8 tctl3

```
volatile blt_int8u tctl3
```

timer control register 3

6.17.2.9 tctl4

```
volatile blt_int8u tctl4
```

timer control register 4

6.17.2.10 tflg1

```
volatile blt_int8u tflg1
```

timer interrupt flag 1

6.17.2.11 tflg2

```
volatile blt_int8u tflg2
```

timer interrupt flag 2

6.17.2.12 tie

volatile [blt_int8u](#) tie

interrupt enable register

6.17.2.13 tios

volatile [blt_int8u](#) tios

input capture/output compare select

6.17.2.14 tscr1

volatile [blt_int8u](#) tscr1

system control register 1

6.17.2.15 tscr2

volatile [blt_int8u](#) tscr2

system control register 2

6.17.2.16 ttov

volatile [blt_int8u](#) ttov

toggle overflow register

The documentation for this struct was generated from the following file:

- [Source/HCS12/timer.c](#)

6.18 tXcpInfo Struct Reference

Structure type for grouping XCP internal module information.

Data Fields

- [blt_int8u](#) connected
- [blt_int8u](#) protection
- [blt_int8u](#) s_n_k_resource
- [blt_int8u](#) ctoData [BOOT_COM_RX_MAX_DATA]
- [blt_int8u](#) ctoPending
- [blt_int16s](#) ctoLen
- [blt_int32u](#) mta

6.18.1 Detailed Description

Structure type for grouping XCP internal module information.

6.18.2 Field Documentation

6.18.2.1 connected

`blt_int8u` connected

connection established

Referenced by `XcpCmdConnect()`, `XcpCmdDisconnect()`, `XcpCmdUnlock()`, `XcpInit()`, `XcplsConnected()`, and `XcpPacketReceived()`.

6.18.2.2 ctoData

`blt_int8u` ctoData[`BOOT_COM_RX_MAX_DATA`]

cto packet data buffer

Referenced by `XcpCmdBuildCheckSum()`, `XcpCmdConnect()`, `XcpCmdDisconnect()`, `XcpCmdGetId()`, `XcpCmd↵`
`GetSeed()`, `XcpCmdGetStatus()`, `XcpCmdProgram()`, `XcpCmdProgramClear()`, `XcpCmdProgramMax()`, `XcpCmd↵`
`ProgramReset()`, `XcpCmdProgramStart()`, `XcpCmdSetMta()`, `XcpCmdShortUpload()`, `XcpCmdUnlock()`, `XcpCmd↵`
`Upload()`, `XcpPacketReceived()`, and `XcpSetCtoError()`.

6.18.2.3 ctoLen

`blt_int16s` ctoLen

cto current packet length

Referenced by `XcpCmdBuildCheckSum()`, `XcpCmdConnect()`, `XcpCmdDisconnect()`, `XcpCmdGetId()`, `XcpCmd↵`
`GetSeed()`, `XcpCmdGetStatus()`, `XcpCmdProgram()`, `XcpCmdProgramClear()`, `XcpCmdProgramMax()`, `XcpCmd↵`
`ProgramReset()`, `XcpCmdProgramStart()`, `XcpCmdSetMta()`, `XcpCmdShortUpload()`, `XcpCmdUnlock()`, `XcpCmd↵`
`Upload()`, `XcpInit()`, `XcpPacketReceived()`, and `XcpSetCtoError()`.

6.18.2.4 ctoPending

`blt_int8u` ctoPending

cto transmission pending flag

Referenced by `XcpInit()`, `XcpPacketReceived()`, and `XcpPacketTransmitted()`.

6.18.2.5 mta

`blt_int32u` mta

memory transfer address

Referenced by `XcpCmdBuildChecksum()`, `XcpCmdGetId()`, `XcpCmdProgram()`, `XcpCmdProgramClear()`, `XcpCmdProgramMax()`, `XcpCmdSetMta()`, `XcpCmdShortUpload()`, `XcpCmdUpload()`, and `XcpInit()`.

6.18.2.6 protection

`blt_int8u` protection

protection state

Referenced by `XcpCmdGetSeed()`, `XcpCmdGetStatus()`, `XcpCmdProgram()`, `XcpCmdProgramClear()`, `XcpCmdProgramMax()`, `XcpCmdProgramPrepare()`, `XcpCmdProgramReset()`, `XcpCmdProgramStart()`, `XcpCmdShortUpload()`, `XcpCmdUnlock()`, `XcpCmdUpload()`, `XcpInit()`, and `XcpProtectResources()`.

6.18.2.7 s_n_k_resource

`blt_int8u` s_n_k_resource

for seed/key sequence

Referenced by `XcpCmdGetSeed()`, `XcpCmdUnlock()`, and `XcpInit()`.

6.19 uip_tcp_appstate_t Struct Reference

Define the `uip_tcp_appstate_t` datatype. This is the state of our tcp/ip application, and the memory required for this state is allocated together with each TCP connection. One application state for each TCP connection.

```
#include <net.h>
```

6.19.1 Detailed Description

Define the `uip_tcp_appstate_t` datatype. This is the state of our tcp/ip application, and the memory required for this state is allocated together with each TCP connection. One application state for each TCP connection.

The documentation for this struct was generated from the following file:

Chapter 7

File Documentation

7.1 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.1.1 Detailed Description

Bootloader application source file.

7.1.2 Function Documentation

7.1.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.1.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.2 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.2.1 Detailed Description

User program application source file.

7.2.2 Function Documentation

7.2.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.2.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.3 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMC00_STM32F0_Nucleo_F091RC_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.3.1 Detailed Description

Bootloader application source file.

7.3.2 Function Documentation

7.3.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.3.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.4 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM0_STM32F0_Nucleo_F091RC_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.4.1 Detailed Description

User program application source file.

7.4.2 Function Documentation

7.4.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.4.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.5 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM0_STM32G0_Nucleo_G071RB_CubeIDE/Boot/App/app.c:

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.5.1 Detailed Description

Bootloader application source file.

7.5.2 Function Documentation

7.5.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.5.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.6 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM0_STM32G0_Nucleo_G071RB_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.6.1 Detailed Description

User program application source file.

7.6.2 Function Documentation

7.6.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.6.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.7 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM33_STM32L5_Nucleo_L552ZE_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.7.1 Detailed Description

Bootloader application source file.

7.7.2 Function Documentation

7.7.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.7.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.8 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM33_STM32L5_Nucleo_L552ZE_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.8.1 Detailed Description

User program application source file.

7.8.2 Function Documentation

7.8.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.8.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.9 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMC3M3_STM32F1_Nucleo_F103RB_CubeIDE/Boot/App/app.c:

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.9.1 Detailed Description

Bootloader application source file.

7.9.2 Function Documentation

7.9.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.9.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.10 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_STM32F1_Nucleo_F103RB_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.10.1 Detailed Description

User program application source file.

7.10.2 Function Documentation

7.10.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.10.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.11 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM3_STM32F1_Olimex_STM32H103_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.11.1 Detailed Description

Bootloader application source file.

7.11.2 Function Documentation

7.11.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.11.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.12 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_STM32F1_Olimex_STM32H103_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.12.1 Detailed Description

User program application source file.

7.12.2 Function Documentation

7.12.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.12.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.13 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMC32F1_Olimex_STM32P103_CubeIDE/Boot/App/app.c:

Functions

- void `AppInit` (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void `AppTask` (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.13.1 Detailed Description

Bootloader application source file.

7.13.2 Function Documentation

7.13.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.13.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.14 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_STM32F1_Olimex_STM32P103_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.14.1 Detailed Description

User program application source file.

7.14.2 Function Documentation

7.14.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.14.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.15 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM3_STM32F1_Olimexino_STM32_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.15.1 Detailed Description

Bootloader application source file.

7.15.2 Function Documentation

7.15.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.15.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.16 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_STM32F1_Olimexino_STM32_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.16.1 Detailed Description

User program application source file.

7.16.2 Function Documentation

7.16.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.16.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.17 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM3_STM32F2_Olimex_STM32P207_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.17.1 Detailed Description

Bootloader application source file.

7.17.2 Function Documentation

7.17.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.17.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.18 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_STM32F2_Olimex_STM32P207_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.18.1 Detailed Description

User program application source file.

7.18.2 Function Documentation

7.18.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.18.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.19 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32F3_Discovery_F303VC_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.19.1 Detailed Description

Bootloader application source file.

7.19.2 Function Documentation

7.19.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.19.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.20 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM4_STM32F3_Discovery_F303VC_CubeIDE/Prog/App/app.c:

Functions

- void [Applnit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.20.1 Detailed Description

User program application source file.

7.20.2 Function Documentation

7.20.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.20.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.21 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32F3_Nucleo_F303K8_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.21.1 Detailed Description

Bootloader application source file.

7.21.2 Function Documentation

7.21.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.21.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.22 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM4_STM32F3_Nucleo_F303K8_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.22.1 Detailed Description

User program application source file.

7.22.2 Function Documentation

7.22.2.1 Applnit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.22.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.23 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
#include "shared_params.h"
```

Include dependency graph for ARMCM4_STM32F4_Nucleo_F429ZI_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.23.1 Detailed Description

Bootloader application source file.

7.23.2 Function Documentation

7.23.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.23.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

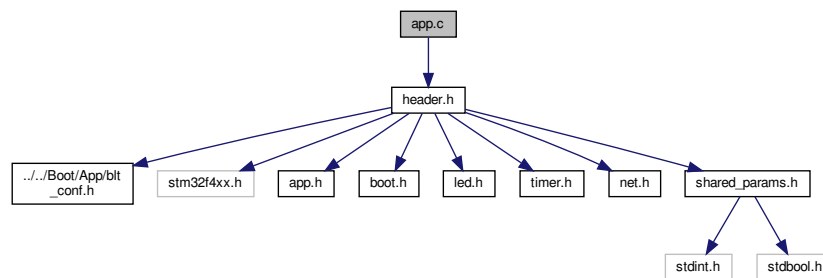

none.

7.24 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMC4_STM32F4_Nucleo_F429ZI_CubeIDE/Prog/App/app.c:

Functions

- void `AppInit` (void)
Initializes the user program application. Should be called once during software program initialization.
- void `AppTask` (void)
Task function of the user program application. Should be called continuously in the program loop.

7.24.1 Detailed Description

User program application source file.

7.24.2 Function Documentation

7.24.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.24.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.25 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32F4_Olimex_STM32P405_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.25.1 Detailed Description

Bootloader application source file.

7.25.2 Function Documentation

7.25.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.25.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.26 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM4_STM32F4_Olimex_STM32P405_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.26.1 Detailed Description

User program application source file.

7.26.2 Function Documentation

7.26.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.26.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.27 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32L4_Nucleo_L476RG_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.27.1 Detailed Description

Bootloader application source file.

7.27.2 Function Documentation

7.27.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.27.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.28 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM4_STM32L4_Nucleo_L476RG_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.28.1 Detailed Description

User program application source file.

7.28.2 Function Documentation

7.28.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.28.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.29 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM7_STM32F7_Nucleo_F746ZG_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.29.1 Detailed Description

Bootloader application source file.

7.29.2 Function Documentation

7.29.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.29.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.30 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM7_STM32F7_Nucleo_F746ZG_CubeIDE/Prog/App/app.c:

Functions

- void `AppInit` (void)
Initializes the user program application. Should be called once during software program initialization.
- void `AppTask` (void)
Task function of the user program application. Should be called continuously in the program loop.

7.30.1 Detailed Description

User program application source file.

7.30.2 Function Documentation

7.30.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.30.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.31 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

```
#include "shared_params.h"
```

Include dependency graph for ARMCM7_STM32F7_Nucleo_F767ZI_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.31.1 Detailed Description

Bootloader application source file.

7.31.2 Function Documentation

7.31.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.31.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

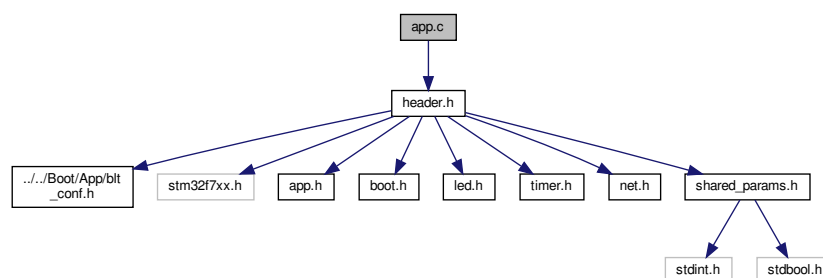

none.

7.32 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM7_STM32F7_Nucleo_F767ZI_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.32.1 Detailed Description

User program application source file.

7.32.2 Function Documentation

7.32.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.32.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.33 app.c File Reference

Bootloader application source file.

```
#include "boot.h"
```

Include dependency graph for ARMC7_STM32H7_Nucleo_H743ZI_CubeIDE/Boot/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.33.1 Detailed Description

Bootloader application source file.

7.33.2 Function Documentation

7.33.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.33.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.34 app.c File Reference

User program application source file.

```
#include "header.h"
```

Include dependency graph for ARMCM7_STM32H7_Nucleo_H743ZI_CubeIDE/Prog/App/app.c:

Functions

- void [AppInit](#) (void)
Initializes the user program application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the user program application. Should be called continuously in the program loop.

7.34.1 Detailed Description

User program application source file.

7.34.2 Function Documentation

7.34.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the user program application. Should be called once during software program initialization.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.34.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the user program application. Should be called continuously in the program loop.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.35 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.35.1 Detailed Description

Bootloader application header file.

7.35.2 Function Documentation

7.35.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.35.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.36 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.36.1 Detailed Description

User program application header file.

7.36.2 Function Documentation

7.36.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.36.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.37 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.37.1 Detailed Description

Bootloader application header file.

7.37.2 Function Documentation

7.37.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.37.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.38 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.38.1 Detailed Description

User program application header file.

7.38.2 Function Documentation

7.38.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.38.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.39 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.39.1 Detailed Description

Bootloader application header file.

7.39.2 Function Documentation

7.39.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.39.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.40 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.40.1 Detailed Description

User program application header file.

7.40.2 Function Documentation

7.40.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.40.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.41 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.41.1 Detailed Description

Bootloader application header file.

7.41.2 Function Documentation

7.41.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.41.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.42 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.42.1 Detailed Description

User program application header file.

7.42.2 Function Documentation

7.42.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.42.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.43 app.h File Reference

Bootloader application header file.

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.43.1 Detailed Description

Bootloader application header file.

7.43.2 Function Documentation

7.43.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.43.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.44 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void `AppInit` (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void `AppTask` (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.44.1 Detailed Description

User program application header file.

7.44.2 Function Documentation

7.44.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.44.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.45 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.45.1 Detailed Description

Bootloader application header file.

7.45.2 Function Documentation

7.45.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.45.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.46 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.46.1 Detailed Description

User program application header file.

7.46.2 Function Documentation

7.46.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.46.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.47 app.h File Reference

Bootloader application header file.

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.47.1 Detailed Description

Bootloader application header file.

7.47.2 Function Documentation

7.47.2.1 Applnit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.47.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.48 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.48.1 Detailed Description

User program application header file.

7.48.2 Function Documentation

7.48.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.48.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.49 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.49.1 Detailed Description

Bootloader application header file.

7.49.2 Function Documentation

7.49.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.49.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.50 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.50.1 Detailed Description

User program application header file.

7.50.2 Function Documentation

7.50.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.50.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.51 app.h File Reference

Bootloader application header file.

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.51.1 Detailed Description

Bootloader application header file.

7.51.2 Function Documentation

7.51.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.51.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.52 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.52.1 Detailed Description

User program application header file.

7.52.2 Function Documentation

7.52.2.1 Applnit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.52.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.53 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.53.1 Detailed Description

Bootloader application header file.

7.53.2 Function Documentation

7.53.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.53.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.54 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.54.1 Detailed Description

User program application header file.

7.54.2 Function Documentation

7.54.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.54.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.55 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.55.1 Detailed Description

Bootloader application header file.

7.55.2 Function Documentation

7.55.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.55.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.56 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.56.1 Detailed Description

User program application header file.

7.56.2 Function Documentation

7.56.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.56.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.57 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.57.1 Detailed Description

Bootloader application header file.

7.57.2 Function Documentation

7.57.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.57.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.58 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.58.1 Detailed Description

User program application header file.

7.58.2 Function Documentation

7.58.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.58.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.59 app.h File Reference

Bootloader application header file.

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.59.1 Detailed Description

Bootloader application header file.

7.59.2 Function Documentation

7.59.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.59.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.60 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.60.1 Detailed Description

User program application header file.

7.60.2 Function Documentation

7.60.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.60.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.61 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.61.1 Detailed Description

Bootloader application header file.

7.61.2 Function Documentation

7.61.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.61.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.62 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.62.1 Detailed Description

User program application header file.

7.62.2 Function Documentation

7.62.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.62.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.63 app.h File Reference

Bootloader application header file.

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.63.1 Detailed Description

Bootloader application header file.

7.63.2 Function Documentation

7.63.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.63.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.64 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.64.1 Detailed Description

User program application header file.

7.64.2 Function Documentation

7.64.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.64.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.65 app.h File Reference

Bootloader application header file.

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.65.1 Detailed Description

Bootloader application header file.

7.65.2 Function Documentation

7.65.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.65.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.66 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.66.1 Detailed Description

User program application header file.

7.66.2 Function Documentation

7.66.2.1 AppInit()

```
void AppInit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.66.2.2 AppTask()

```
void AppTask (
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.67 app.h File Reference

Bootloader application header file.

Functions

- void [Applnit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.67.1 Detailed Description

Bootloader application header file.

7.67.2 Function Documentation

7.67.2.1 Applnit()

```
void Applnit (
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.67.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.68 app.h File Reference

User program application header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [AppInit](#) (void)
Initializes the bootloader application. Should be called once during software program initialization.
- void [AppTask](#) (void)
Task function of the bootloader application. Should be called continuously in the program loop.

7.68.1 Detailed Description

User program application header file.

7.68.2 Function Documentation

7.68.2.1 AppInit()

```
void AppInit (  
    void )
```

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

Initializes the bootloader application. Should be called once during software program initialization.

Returns

none.

7.68.2.2 AppTask()

```
void AppTask (  
    void )
```

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

Task function of the bootloader application. Should be called continuously in the program loop.

Returns

none.

7.69 asserts.c File Reference

Bootloader assertion module source file.

```
#include "boot.h"
```

Include dependency graph for asserts.c:

Functions

- void [AssertFailure](#) (blt_char *file, blt_int32u line)

Called when a runtime assertion failed. It stores information about where the assertion occurred and halts the software program.

7.69.1 Detailed Description

Bootloader assertion module source file.

7.69.2 Function Documentation

7.69.2.1 AssertFailure()

```
void AssertFailure (
    blt_char * file,
    blt_int32u line )
```

Called when a runtime assertion failed. It stores information about where the assertion occurred and halts the software program.

Parameters

<i>file</i>	Name of the source file where the assertion occurred.
<i>line</i>	Linenumber in the source file where the assertion occurred.

Returns

none

7.70 asserts.h File Reference

Bootloader assertion module header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define ASSERT_CT(cond) enum { ASSERT_CONCAT(assert_error_on_line_, __LINE__) = 1/(!(cond)) }`
Macro for assertions that can be performed at compile time.
- `#define ASSERT_RT(cond)`
Macro for assertions that can only be performed at run time.

Functions

- `void AssertFailure (blt_char *file, blt_int32u line)`
Called when a runtime assertion failed. It stores information about where the assertion occurred and halts the software program.

7.70.1 Detailed Description

Bootloader assertion module header file.

7.70.2 Function Documentation

7.70.2.1 AssertFailure()

```
void AssertFailure (
    blt_char * file,
    blt_int32u line )
```

Called when a runtime assertion failed. It stores information about where the assertion occurred and halts the software program.

Parameters

<i>file</i>	Name of the source file where the assertion occurred.
<i>line</i>	Linenumber in the source file where the assertion occurred.

Returns

none

7.71 backdoor.c File Reference

Bootloader backdoor entry source file.

```
#include "boot.h"
```

Include dependency graph for backdoor.c:

Functions

- void [BackDoorInitHook](#) (void)
Initializes the backdoor entry option.
- [blt_bool BackDoorEntryHook](#) (void)
Checks if a backdoor entry is requested.
- void [BackDoorInit](#) (void)
Initializes the backdoor entry option.
- void [BackDoorCheck](#) (void)
The default backdoor entry feature keeps the bootloader active for a predetermined time after reset, allowing the host application to establish a connection and start a programming sequence. This function controls the opening/closing of the backdoor.

7.71.1 Detailed Description

Bootloader backdoor entry source file.

7.71.2 Function Documentation

7.71.2.1 BackDoorCheck()

```
void BackDoorCheck (
    void )
```

The default backdoor entry feature keeps the bootloader active for a predetermined time after reset, allowing the host application to establish a connection and start a programming sequence. This function controls the opening/closing of the backdoor.

Returns

none

Referenced by BackDoorInit(), and BootTask().

7.71.2.2 BackDoorEntryHook()

```
blt_bool BackDoorEntryHook (
    void )
```

Checks if a backdoor entry is requested.

Returns

BLT_TRUE if the backdoor entry is requested, BLT_FALSE otherwise.

Referenced by BackDoorInit(), and UsbLeaveLowPowerModeHook().

7.71.2.3 BackDoorInit()

```
void BackDoorInit (
    void )
```

Initializes the backdoor entry option.

Returns

none

Referenced by BootInit().

7.71.2.4 BackDoorInitHook()

```
void BackDoorInitHook (
    void )
```

Initializes the backdoor entry option.

Returns

none.

Referenced by BackDoorInit(), and UsbLeaveLowPowerModeHook().

7.72 backdoor.h File Reference

Bootloader backdoor entry header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BackDoorInit](#) (void)
Initializes the backdoor entry option.
- void [BackDoorCheck](#) (void)
The default backdoor entry feature keeps the bootloader active for a predetermined time after reset, allowing the host application to establish a connection and start a programming sequence. This function controls the opening/closing of the backdoor.

7.72.1 Detailed Description

Bootloader backdoor entry header file.

7.72.2 Function Documentation

7.72.2.1 BackDoorCheck()

```
void BackDoorCheck (
    void )
```

The default backdoor entry feature keeps the bootloader active for a predetermined time after reset, allowing the host application to establish a connection and start a programming sequence. This function controls the opening/closing of the backdoor.

Returns

none

Referenced by BackDoorInit(), and BootTask().

7.72.2.2 BackDoorInit()

```
void BackDoorInit (
    void )
```

Initializes the backdoor entry option.

Returns

none

Referenced by BootInit().

7.73 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- #define `BOOT_CPU_XTAL_SPEED_KHZ` (8000)
Frequency of the external crystal oscillator.
- #define `BOOT_CPU_SYSTEM_SPEED_KHZ` (72000)
Desired system speed.
- #define `BOOT_CPU_BYTE_ORDER_MOTOROLA` (0)
Motorola or Intel style byte ordering.
- #define `BOOT_CPU_USER_PROGRAM_START_HOOK` (1)
Enable/disable hook function call right before user program start.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (1)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (128)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

7.73.1 Detailed Description

Bootloader configuration header file.

7.74 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (48000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_RS232_ENABLE (1)`
Enable/disable UART transport layer.
- `#define BOOT_COM_RS232_BAUDRATE (57600)`
Configure the desired communication speed.
- `#define BOOT_COM_RS232_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_RS232_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_RS232_CHANNEL_INDEX (1)`
Select the desired UART peripheral as a zero based index.
- `#define BOOT_BACKDOOR_HOOKS_ENABLE (0)`
Enable/disable the backdoor override hook functions.
- `#define BOOT_NVM_HOOKS_ENABLE (0)`
Enable/disable the NVM hook function for supporting additional memory devices.
- `#define BOOT_NVM_SIZE_KB (64)`
Configure the size of the default memory device (typically flash EEPROM).
- `#define BOOT_NVM_CHECKSUM_HOOKS_ENABLE (0)`
Enable/disable hooks functions to override the user program checksum handling.
- `#define BOOT_FLASH_CUSTOM_LAYOUT_ENABLE (1)`
Enable support for a custom flash layout table. It is located in flash_layout.c. This was done because the default flashLayout[] table in the bootloader's core has more flash memory reserved for the bootloader than is needed for this demo.
- `#define BOOT_COP_HOOKS_ENABLE (1)`
Enable/disable the hook functions for controlling the watchdog.

7.74.1 Detailed Description

Bootloader configuration header file.

7.75 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (48000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_RS232_ENABLE (1)`
Enable/disable UART transport layer.
- `#define BOOT_COM_RS232_BAUDRATE (57600)`
Configure the desired communication speed.
- `#define BOOT_COM_RS232_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_RS232_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_RS232_CHANNEL_INDEX (1)`
Select the desired UART peripheral as a zero based index.
- `#define BOOT_BACKDOOR_HOOKS_ENABLE (0)`

- *Enable/disable the backdoor override hook functions.*
• #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (64)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` (1)
Enable support for a custom flash layout table. It is located in flash_layout.c. This was done because the default flashLayout[] table in the bootloader's core has more flash memory reserved for the bootloader than is needed for this demo.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

- #define `BOOT_CPU_BYTE_ORDER_MOTOROLA` (0)
Motorola or Intel style byte ordering.
- #define `BOOT_CPU_USER_PROGRAM_START_HOOK` (1)
Enable/disable hook function call right before user program start.
- #define `BOOT_COM_CAN_ENABLE` (1)
Enable/disable CAN transport layer.
- #define `BOOT_COM_CAN_BAUDRATE` (500000)
Configure the desired CAN baudrate.
- #define `BOOT_COM_CAN_TX_MSG_ID` (0x7E1 /*| 0x80000000*/) *Configure CAN message ID target->host.*
- #define `BOOT_COM_CAN_TX_MAX_DATA` (8)
Configure number of bytes in the target->host CAN message.
- #define `BOOT_COM_CAN_RX_MSG_ID` (0x667 /*| 0x80000000*/) *Configure CAN message ID host->target.*
- #define `BOOT_COM_CAN_RX_MAX_DATA` (8)
Configure number of bytes in the host->target CAN message.
- #define `BOOT_COM_CAN_CHANNEL_INDEX` (1)
Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (1)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (200)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

7.87.1 Detailed Description

Bootloader configuration header file.

7.88 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (16000)`
Frequency of the external crystal or internal (HSI/MSI) oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (96000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_USB_ENABLE (1)`
Enable/disable USB transport layer.
- `#define BOOT_COM_USB_TX_MAX_DATA (63)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_USB_RX_MAX_DATA (63)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_CAN_ENABLE (1)`
Enable/disable CAN transport layer.
- `#define BOOT_COM_CAN_BAUDRATE (500000)`
Configure the desired CAN baudrate.
- `#define BOOT_COM_CAN_TX_MSG_ID (0x7E1 /*| 0x80000000*/)`
Configure CAN message ID target->host.
- `#define BOOT_COM_CAN_TX_MAX_DATA (8)`
Configure number of bytes in the target->host CAN message.
- `#define BOOT_COM_CAN_RX_MSG_ID (0x667 /*| 0x80000000*/)`
Configure CAN message ID host->target.
- `#define BOOT_COM_CAN_RX_MAX_DATA (8)`

- *Configure number of bytes in the host->target CAN message.*
 • #define `BOOT_COM_CAN_CHANNEL_INDEX` (0)
Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (5)
Select the desired UART peripheral as a zero based index. Note that the LPUART peripherals come after the U(↔S)ART peripherals.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (512)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

Enable/disable the hook functions for controlling the watchdog.

7.93.1 Detailed Description

Bootloader configuration header file.

7.94 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (50000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_RS232_ENABLE (1)`
Enable/disable UART transport layer.
- `#define BOOT_COM_RS232_BAUDRATE (57600)`
Configure the desired communication speed.
- `#define BOOT_COM_RS232_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_RS232_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_RS232_CHANNEL_INDEX (0)`
Select the desired UART peripheral as a zero based index.
- `#define BOOT_COM_NET_ENABLE (1)`
Enable/disable the NET transport layer.
- `#define BOOT_COM_NET_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_NET_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.

- `#define BOOT_COM_NET_PORT (1000)`
Configure the port that the TCP/IP server listens on.
- `#define BOOT_COM_NET_DHCP_ENABLE (1)`
Enable/disable DHCP client for automatically obtaining an IP address.
- `#define BOOT_COM_NET_IPADDR0 (192)`
Configure the 1st byte of the IP address.
- `#define BOOT_COM_NET_IPADDR1 (168)`
Configure the 2nd byte of the IP address.
- `#define BOOT_COM_NET_IPADDR2 (178)`
Configure the 3rd byte of the IP address.
- `#define BOOT_COM_NET_IPADDR3 (50)`
Configure the 4th byte of the IP address.
- `#define BOOT_COM_NET_NETMASK0 (255)`
Configure the 1st byte of the network mask.
- `#define BOOT_COM_NET_NETMASK1 (255)`
Configure the 2nd byte of the network mask.
- `#define BOOT_COM_NET_NETMASK2 (255)`
Configure the 3rd byte of the network mask.
- `#define BOOT_COM_NET_NETMASK3 (0)`
Configure the 4th byte of the network mask.
- `#define BOOT_COM_NET_GATEWAY0 (192)`
Configure the 1st byte of the gateway address.
- `#define BOOT_COM_NET_GATEWAY1 (168)`
Configure the 2nd byte of the gateway address.
- `#define BOOT_COM_NET_GATEWAY2 (178)`
Configure the 3rd byte of the gateway address.
- `#define BOOT_COM_NET_GATEWAY3 (1)`
Configure the 4th byte of the gateway address.
- `#define BOOT_COM_NET_DEFERRED_INIT_ENABLE (1)`
Enable/disable the deferred initialization mechanism. When enabled, the communication interface is only initialized when: (a) no valid user program is detected, or (b) when `CpuUserProgramStartHook()` returns `BLT_FALSE`. Your bootloader application can explicitly initialize the communication interface by calling `ComDeferredInit()`.
- `#define BOOT_FILE_SYS_ENABLE (1)`
Enable/disable support for firmware updates from a locally attached storage.
- `#define BOOT_FILE_LOGGING_ENABLE (1)`
Enable/disable logging messages during firmware updates.
- `#define BOOT_FILE_ERROR_HOOK_ENABLE (1)`
Enable/disable a hook function that is called upon detection of an error.
- `#define BOOT_FILE_STARTED_HOOK_ENABLE (1)`
Enable/disable a hook function that is called at the start of the update.
- `#define BOOT_FILE_COMPLETED_HOOK_ENABLE (1)`
Enable/disable a hook function that is called at the end of the update.
- `#define BOOT_BACKDOOR_HOOKS_ENABLE (0)`
Enable/disable the backdoor override hook functions.
- `#define BOOT_NVM_HOOKS_ENABLE (0)`
Enable/disable the NVM hook function for supporting additional memory devices.
- `#define BOOT_NVM_SIZE_KB (256)`
Configure the size of the default memory device (typically flash EEPROM).
- `#define BOOT_NVM_CHECKSUM_HOOKS_ENABLE (0)`
Enable/disable hooks functions to override the user program checksum handling.
- `#define BOOT_COP_HOOKS_ENABLE (0)`
Enable/disable the hook functions for controlling the watchdog.

7.94.1 Detailed Description

Bootloader configuration header file.

7.95 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (0)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_CAN_ENABLE (1)`
Enable/disable CAN transport layer.
- `#define BOOT_COM_CAN_BAUDRATE (500000)`
Configure the desired CAN baudrate.
- `#define BOOT_COM_CAN_TX_MSG_ID (0x7E1 /*| 0x80000000*/)`
Configure CAN message ID target->host.
- `#define BOOT_COM_CAN_TX_MAX_DATA (8)`
Configure number of bytes in the target->host CAN message.
- `#define BOOT_COM_CAN_RX_MSG_ID (0x667 /*| 0x80000000*/)`
Configure CAN message ID host->target.
- `#define BOOT_COM_CAN_RX_MAX_DATA (8)`
Configure number of bytes in the host->target CAN message.
- `#define BOOT_COM_CAN_CHANNEL_INDEX (0)`
Select the desired CAN peripheral as a zero based index.
- `#define BOOT_COM_RS232_ENABLE (1)`

- *Enable/disable UART transport layer.*
- `#define BOOT_COM_RS232_BAUDRATE (57600)`
Configure the desired communication speed.
- `#define BOOT_COM_RS232_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_RS232_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_RS232_CHANNEL_INDEX (0)`
Select the desired UART peripheral as a zero based index.
- `#define BOOT_BACKDOOR_HOOKS_ENABLE (0)`
Enable/disable the backdoor override hook functions.
- `#define BOOT_NVM_HOOKS_ENABLE (0)`
Enable/disable the NVM hook function for supporting additional memory devices.
- `#define BOOT_NVM_SIZE_KB (256)`
Configure the size of the default memory device (typically flash EEPROM).
- `#define BOOT_NVM_CHECKSUM_HOOKS_ENABLE (0)`
Enable/disable hooks functions to override the user program checksum handling.
- `#define BOOT_FLASH_CUSTOM_LAYOUT_ENABLE (1)`
Enable support for a custom flash layout table. It is located in flash_layout.c. This was done because the default flashLayout[] table in the bootloader's core has more flash memory reserved for the bootloader than is needed for this demo.
- `#define BOOT_COP_HOOKS_ENABLE (0)`
Enable/disable the hook functions for controlling the watchdog.

7.96.1 Detailed Description

Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)

Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)

Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)

Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)

Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (1)

Select the desired UART peripheral as a zero based index.
- #define `BOOT_FILE_SYS_ENABLE` (1)

Enable/disable support for firmware updates from a locally attached storage.
- #define `BOOT_FILE_LOGGING_ENABLE` (1)

Enable/disable logging messages during firmware updates.
- #define `BOOT_FILE_ERROR_HOOK_ENABLE` (1)

Enable/disable a hook function that is called upon detection of an error.
- #define `BOOT_FILE_STARTED_HOOK_ENABLE` (1)

Enable/disable a hook function that is called at the start of the update.
- #define `BOOT_FILE_COMPLETED_HOOK_ENABLE` (1)

Enable/disable a hook function that is called at the end of the update.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)

Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)

Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (128)

Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)

Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_FLASH_VECTOR_TABLE_CS_OFFSET` (0x10c)

This microcontroller has a smaller vector table then the default STM32F1xx project as assumed in the bootloader's core. This means the user program has a different checksum location, because this one is added at the end of the user program's vector table.
- #define `BOOT_COP_HOOKS_ENABLE` (1)

Enable/disable the hook functions for controlling the watchdog.

7.107.1 Detailed Description

Bootloader configuration header file.

7.108 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (72000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_CAN_ENABLE (1)`
Enable/disable CAN transport layer.
- `#define BOOT_COM_CAN_BAUDRATE (500000)`
Configure the desired CAN baudrate.
- `#define BOOT_COM_CAN_TX_MSG_ID (0x7E1 /*| 0x80000000*/)`
Configure CAN message ID target->host.
- `#define BOOT_COM_CAN_TX_MAX_DATA (8)`
Configure number of bytes in the target->host CAN message.
- `#define BOOT_COM_CAN_RX_MSG_ID (0x667 /*| 0x80000000*/)`
Configure CAN message ID host->target.
- `#define BOOT_COM_CAN_RX_MAX_DATA (8)`
Configure number of bytes in the host->target CAN message.
- `#define BOOT_COM_CAN_CHANNEL_INDEX (0)`
Select the desired CAN peripheral as a zero based index.
- `#define BOOT_COM_RS232_ENABLE (1)`
Enable/disable UART transport layer.

- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (2)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_FILE_SYS_ENABLE` (1)
Enable/disable support for firmware updates from a locally attached storage.
- #define `BOOT_FILE_LOGGING_ENABLE` (1)
Enable/disable logging messages during firmware updates.
- #define `BOOT_FILE_ERROR_HOOK_ENABLE` (1)
Enable/disable a hook function that is called upon detection of an error.
- #define `BOOT_FILE_STARTED_HOOK_ENABLE` (1)
Enable/disable a hook function that is called at the start of the update.
- #define `BOOT_FILE_COMPLETED_HOOK_ENABLE` (1)
Enable/disable a hook function that is called at the end of the update.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (512)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

 • #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (1)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (64)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

Bootloader configuration header file.

7.126 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- #define `BOOT_CPU_XTAL_SPEED_KHZ` (8000)
Frequency of the external crystal oscillator.
- #define `BOOT_CPU_SYSTEM_SPEED_KHZ` (64000)
Desired system speed.
- #define `BOOT_CPU_BYTE_ORDER_MOTOROLA` (0)
Motorola or Intel style byte ordering.
- #define `BOOT_CPU_USER_PROGRAM_START_HOOK` (1)
Enable/disable hook function call right before user program start.
- #define `BOOT_COM_CAN_ENABLE` (1)
Enable/disable CAN transport layer.
- #define `BOOT_COM_CAN_BAUDRATE` (500000)
Configure the desired CAN baudrate.
- #define `BOOT_COM_CAN_TX_MSG_ID` (0x7E1 /*| 0x80000000*/) *Configure CAN message ID target->host.*
- #define `BOOT_COM_CAN_TX_MAX_DATA` (8)
Configure number of bytes in the target->host CAN message.
- #define `BOOT_COM_CAN_RX_MSG_ID` (0x667 /*| 0x80000000*/) *Configure CAN message ID host->target.*
- #define `BOOT_COM_CAN_RX_MAX_DATA` (8)
Configure number of bytes in the host->target CAN message.
- #define `BOOT_COM_CAN_CHANNEL_INDEX` (0)
Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (1)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (64)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

Enable/disable the hook functions for controlling the watchdog.

7.127.1 Detailed Description

Bootloader configuration header file.

7.128 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (168000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_NET_ENABLE (1)`
Enable/disable the NET transport layer.
- `#define BOOT_COM_NET_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_NET_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_NET_PORT (1000)`
Configure the port that the TCP/IP server listens on.
- `#define BOOT_COM_NET_DHCP_ENABLE (1)`
Enable/disable DHCP client for automatically obtaining an IP address.
- `#define BOOT_COM_NET_IPADDR0 (192)`
Configure the 1st byte of the IP address.
- `#define BOOT_COM_NET_IPADDR1 (168)`
Configure the 2nd byte of the IP address.
- `#define BOOT_COM_NET_IPADDR2 (178)`
Configure the 3rd byte of the IP address.
- `#define BOOT_COM_NET_IPADDR3 (50)`
Configure the 4th byte of the IP address.
- `#define BOOT_COM_NET_NETMASK0 (255)`
Configure the 1st byte of the network mask.
- `#define BOOT_COM_NET_NETMASK1 (255)`
Configure the 2nd byte of the network mask.
- `#define BOOT_COM_NET_NETMASK2 (255)`
Configure the 3rd byte of the network mask.
- `#define BOOT_COM_NET_NETMASK3 (0)`
Configure the 4th byte of the network mask.
- `#define BOOT_COM_NET_GATEWAY0 (192)`
Configure the 1st byte of the gateway address.
- `#define BOOT_COM_NET_GATEWAY1 (168)`
Configure the 2nd byte of the gateway address.
- `#define BOOT_COM_NET_GATEWAY2 (178)`
Configure the 3rd byte of the gateway address.
- `#define BOOT_COM_NET_GATEWAY3 (1)`
Configure the 4th byte of the gateway address.
- `#define BOOT_COM_NET_DEFERRED_INIT_ENABLE (1)`
Enable/disable the deferred initialization mechanism. When enabled, the communication interface is only initialized when: (a) no valid user program is detected, or (b) when `CpuUserProgramStartHook()` returns `BLT_FALSE`. Your bootloader application can explicitly initialize the communication interface by calling `ComDeferredInit()`.
- `#define BOOT_COM_USB_ENABLE (1)`
Enable/disable USB transport layer.
- `#define BOOT_COM_USB_TX_MAX_DATA (63)`

- Configure number of bytes in the target->host data packet.*

 - #define `BOOT_COM_USB_RX_MAX_DATA` (63)
- Configure number of bytes in the host->target data packet.*

 - #define `BOOT_COM_CAN_ENABLE` (1)
- Enable/disable CAN transport layer.*

 - #define `BOOT_COM_CAN_BAUDRATE` (500000)
- Configure the desired CAN baudrate.*

 - #define `BOOT_COM_CAN_TX_MSG_ID` (0x7E1 /*| 0x80000000*/)
- Configure CAN message ID target->host.*

 - #define `BOOT_COM_CAN_TX_MAX_DATA` (8)
- Configure number of bytes in the target->host CAN message.*

 - #define `BOOT_COM_CAN_RX_MSG_ID` (0x667 /*| 0x80000000*/)
- Configure CAN message ID host->target.*

 - #define `BOOT_COM_CAN_RX_MAX_DATA` (8)
- Configure number of bytes in the host->target CAN message.*

 - #define `BOOT_COM_CAN_CHANNEL_INDEX` (0)
- Select the desired CAN peripheral as a zero based index.*

 - #define `BOOT_COM_RS232_ENABLE` (1)
- Enable/disable UART transport layer.*

 - #define `BOOT_COM_RS232_BAUDRATE` (57600)
- Configure the desired communication speed.*

 - #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
- Configure number of bytes in the target->host data packet.*

 - #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
- Configure number of bytes in the host->target data packet.*

 - #define `BOOT_COM_RS232_CHANNEL_INDEX` (2)
- Select the desired UART peripheral as a zero based index.*

 - #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
- Enable/disable the backdoor override hook functions.*

 - #define `BOOT_NVM_HOOKS_ENABLE` (0)
- Enable/disable the NVM hook function for supporting additional memory devices.*

 - #define `BOOT_NVM_SIZE_KB` (2048)
- Configure the size of the default memory device (typically flash EEPROM).*

 - #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
- Enable/disable hooks functions to override the user program checksum handling.*

 - #define `BOOT_FLASH_VECTOR_TABLE_CS_OFFSET` (0x1AC)
- This microcontroller has a larger vector table then the default STM32F7xx project as assumed in the bootloader's core. This means the user program has a different checksum location, because this one is added at the end of the user program's vector table.*

 - #define `BOOT_COP_HOOKS_ENABLE` (1)
- Enable/disable the hook functions for controlling the watchdog.*

- Configure number of bytes in the target->host data packet.*

 - #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
- Configure number of bytes in the host->target data packet.*

 - #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
- Select the desired UART peripheral as a zero based index.*

 - #define `BOOT_COM_RS232_CHANNEL_INDEX` (2)

- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (2048)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_FLASH_VECTOR_TABLE_CS_OFFSET` (0x1AC)
This microcontroller has a larger vector table then the default STM32F7xx project as assumed in the bootloader's core. This means the user program has a different checksum location, because this one is added at the end of the user program's vector table.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

Bootloader configuration header file.

7.132 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- #define `BOOT_CPU_XTAL_SPEED_KHZ` (8000)
Frequency of the external crystal oscillator.
- #define `BOOT_CPU_SYSTEM_SPEED_KHZ` (168000)
Desired system speed.
- #define `BOOT_CPU_BYTE_ORDER_MOTOROLA` (0)
Motorola or Intel style byte ordering.
- #define `BOOT_CPU_USER_PROGRAM_START_HOOK` (1)
Enable/disable hook function call right before user program start.
- #define `BOOT_COM_CAN_ENABLE` (1)
Enable/disable CAN transport layer.
- #define `BOOT_COM_CAN_BAUDRATE` (500000)
Configure the desired CAN baudrate.
- #define `BOOT_COM_CAN_TX_MSG_ID` (0x7E1 /*| 0x80000000*/) *Configure CAN message ID target->host.*
- #define `BOOT_COM_CAN_TX_MAX_DATA` (8)
Configure number of bytes in the target->host CAN message.
- #define `BOOT_COM_CAN_RX_MSG_ID` (0x667 /*| 0x80000000*/) *Configure CAN message ID host->target.*
- #define `BOOT_COM_CAN_RX_MAX_DATA` (8)
Configure number of bytes in the host->target CAN message.
- #define `BOOT_COM_CAN_CHANNEL_INDEX` (0)
Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (1)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_COM_USB_ENABLE` (1)
Enable/disable USB transport layer.
- #define `BOOT_COM_USB_TX_MAX_DATA` (63)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_USB_RX_MAX_DATA` (63)
Configure number of bytes in the host->target data packet.
- #define `BOOT_FILE_SYS_ENABLE` (1)
Enable/disable support for firmware updates from a locally attached storage.
- #define `BOOT_FILE_LOGGING_ENABLE` (1)
Enable/disable logging messages during firmware updates.
- #define `BOOT_FILE_ERROR_HOOK_ENABLE` (1)
Enable/disable a hook function that is called upon detection of an error.
- #define `BOOT_FILE_STARTED_HOOK_ENABLE` (1)
Enable/disable a hook function that is called at the start of the update.
- #define `BOOT_FILE_COMPLETED_HOOK_ENABLE` (1)
Enable/disable a hook function that is called at the end of the update.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)

- *Enable/disable the backdoor override hook functions.*
 • #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (1024)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (1)
Enable/disable the hook functions for controlling the watchdog.

- `#define BOOT_COM_USB_RX_MAX_DATA (63)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_FILE_SYS_ENABLE (1)`
Enable/disable support for firmware updates from a locally attached storage.

- `#define BOOT_FILE_LOGGING_ENABLE (1)`
Enable/disable logging messages during firmware updates.
- `#define BOOT_FILE_ERROR_HOOK_ENABLE (1)`
Enable/disable a hook function that is called upon detection of an error.
- `#define BOOT_FILE_STARTED_HOOK_ENABLE (1)`
Enable/disable a hook function that is called at the start of the update.
- `#define BOOT_FILE_COMPLETED_HOOK_ENABLE (1)`
Enable/disable a hook function that is called at the end of the update.
- `#define BOOT_BACKDOOR_HOOKS_ENABLE (0)`
Enable/disable the backdoor override hook functions.
- `#define BOOT_NVM_HOOKS_ENABLE (0)`
Enable/disable the NVM hook function for supporting additional memory devices.
- `#define BOOT_NVM_SIZE_KB (256)`
Configure the size of the default memory device (typically flash EEPROM).
- `#define BOOT_NVM_CHECKSUM_HOOKS_ENABLE (0)`
Enable/disable hooks functions to override the user program checksum handling.
- `#define BOOT_COP_HOOKS_ENABLE (0)`
Enable/disable the hook functions for controlling the watchdog.

7.140.1 Detailed Description

Bootloader configuration header file.

7.141 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- #define `BOOT_CPU_XTAL_SPEED_KHZ` (12000)
Frequency of the external crystal oscillator.
- #define `BOOT_CPU_SYSTEM_SPEED_KHZ` (144000)
Desired system speed.
- #define `BOOT_CPU_BYTE_ORDER_MOTOROLA` (0)
Motorola or Intel style byte ordering.
- #define `BOOT_CPU_USER_PROGRAM_START_HOOK` (1)
Enable/disable hook function call right before user program start.
- #define `BOOT_COM_CAN_ENABLE` (1)
Enable/disable CAN transport layer.
- #define `BOOT_COM_CAN_BAUDRATE` (500000)
Configure the desired CAN baudrate.
- #define `BOOT_COM_CAN_TX_MSG_ID` (0x7E1 /*| 0x80000000*/) *Configure CAN message ID target->host.*
- #define `BOOT_COM_CAN_TX_MAX_DATA` (8)
Configure number of bytes in the target->host CAN message.
- #define `BOOT_COM_CAN_RX_MSG_ID` (0x667 /*| 0x80000000*/) *Configure CAN message ID host->target.*
- #define `BOOT_COM_CAN_RX_MAX_DATA` (8)
Configure number of bytes in the host->target CAN message.
- #define `BOOT_COM_CAN_CHANNEL_INDEX` (1)
Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (0)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_COM_NET_ENABLE` (1)
Enable/disable the NET transport layer.
- #define `BOOT_COM_NET_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_NET_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_NET_PORT` (1000)
Configure the port that the TCP/IP server listens on.
- #define `BOOT_COM_NET_DHCP_ENABLE` (1)
Enable/disable DHCP client for automatically obtaining an IP address.
- #define `BOOT_COM_NET_IPADDR0` (192)
Configure the 1st byte of the IP address.
- #define `BOOT_COM_NET_IPADDR1` (168)
Configure the 2nd byte of the IP address.
- #define `BOOT_COM_NET_IPADDR2` (178)
Configure the 3rd byte of the IP address.
- #define `BOOT_COM_NET_IPADDR3` (50)

- Configure the 4th byte of the IP address.*

 - #define `BOOT_COM_NET_NETMASK0` (255)

Configure the 1st byte of the network mask.

 - #define `BOOT_COM_NET_NETMASK1` (255)

Configure the 2nd byte of the network mask.

 - #define `BOOT_COM_NET_NETMASK2` (255)

Configure the 3rd byte of the network mask.

 - #define `BOOT_COM_NET_NETMASK3` (0)

Configure the 4th byte of the network mask.

 - #define `BOOT_COM_NET_GATEWAY0` (192)

Configure the 1st byte of the gateway address.

 - #define `BOOT_COM_NET_GATEWAY1` (168)

Configure the 2nd byte of the gateway address.

 - #define `BOOT_COM_NET_GATEWAY2` (178)

Configure the 3rd byte of the gateway address.

 - #define `BOOT_COM_NET_GATEWAY3` (1)

Configure the 4th byte of the gateway address.

 - #define `BOOT_COM_NET_DEFERRED_INIT_ENABLE` (1)

Enable/disable the deferred initialization mechanism. When enabled, the communication interface is only initialized when: (a) no valid user program is detected, or (b) when `CpuUserProgramStartHook()` returns `BLT_FALSE`. Your bootloader application can explicitly initialize the communication interface by calling `ComDeferredInit()`.

 - #define `BOOT_FILE_SYS_ENABLE` (1)

Enable/disable support for firmware updates from a locally attached storage.

 - #define `BOOT_FILE_LOGGING_ENABLE` (1)

Enable/disable logging messages during firmware updates.

 - #define `BOOT_FILE_ERROR_HOOK_ENABLE` (1)

Enable/disable a hook function that is called upon detection of an error.

 - #define `BOOT_FILE_STARTED_HOOK_ENABLE` (1)

Enable/disable a hook function that is called at the start of the update.

 - #define `BOOT_FILE_COMPLETED_HOOK_ENABLE` (1)

Enable/disable a hook function that is called at the end of the update.

 - #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)

Enable/disable the backdoor override hook functions.

 - #define `BOOT_NVM_HOOKS_ENABLE` (0)

Enable/disable the NVM hook function for supporting additional memory devices.

 - #define `BOOT_NVM_SIZE_KB` (2048)

Configure the size of the default memory device (typically flash EEPROM).

 - #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)

Enable/disable hooks functions to override the user program checksum handling.

 - #define `BOOT_COP_HOOKS_ENABLE` (1)

Enable/disable the hook functions for controlling the watchdog.

- #define [BOOT_COM_RS232_BAUDRATE](#) (57600)
Configure the desired communication speed.
- #define [BOOT_COM_RS232_TX_MAX_DATA](#) (64)
Configure number of bytes in the target->host data packet.
- #define [BOOT_COM_RS232_RX_MAX_DATA](#) (64)
Configure number of bytes in the host->target data packet.
- #define [BOOT_COM_RS232_CHANNEL_INDEX](#) (2)
Select the desired UART peripheral as a zero based index.
- #define [BOOT_BACKDOOR_HOOKS_ENABLE](#) (0)
Enable/disable the backdoor override hook functions.
- #define [BOOT_NVM_HOOKS_ENABLE](#) (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define [BOOT_NVM_SIZE_KB](#) (2048)
Configure the size of the default memory device (typically flash EEPROM).
- #define [BOOT_NVM_CHECKSUM_HOOKS_ENABLE](#) (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x1F8)
This microcontroller has a larger vector table then the default STM32F7xx project as assumed in the bootloader's core. This means the user program has a different checksum location, because this one is added at the end of the user program's vector table.
- #define [BOOT_COP_HOOKS_ENABLE](#) (1)
Enable/disable the hook functions for controlling the watchdog.

7.147.1 Detailed Description

Bootloader configuration header file.

7.148 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (216000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (0)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (1)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_NET_ENABLE (1)`
Enable/disable the NET transport layer.
- `#define BOOT_COM_NET_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_NET_RX_MAX_DATA (64)`
Configure number of bytes in the host->target data packet.
- `#define BOOT_COM_NET_PORT (1000)`
Configure the port that the TCP/IP server listens on.
- `#define BOOT_COM_NET_DHCP_ENABLE (1)`
Enable/disable DHCP client for automatically obtaining an IP address.
- `#define BOOT_COM_NET_IPADDR0 (192)`
Configure the 1st byte of the IP address.

- #define [BOOT_COM_NET_IPADDR1](#) (168)
Configure the 2nd byte of the IP address.
- #define [BOOT_COM_NET_IPADDR2](#) (178)
Configure the 3rd byte of the IP address.
- #define [BOOT_COM_NET_IPADDR3](#) (50)
Configure the 4th byte of the IP address.
- #define [BOOT_COM_NET_NETMASK0](#) (255)
Configure the 1st byte of the network mask.
- #define [BOOT_COM_NET_NETMASK1](#) (255)
Configure the 2nd byte of the network mask.
- #define [BOOT_COM_NET_NETMASK2](#) (255)
Configure the 3rd byte of the network mask.
- #define [BOOT_COM_NET_NETMASK3](#) (0)
Configure the 4th byte of the network mask.
- #define [BOOT_COM_NET_GATEWAY0](#) (192)
Configure the 1st byte of the gateway address.
- #define [BOOT_COM_NET_GATEWAY1](#) (168)
Configure the 2nd byte of the gateway address.
- #define [BOOT_COM_NET_GATEWAY2](#) (178)
Configure the 3rd byte of the gateway address.
- #define [BOOT_COM_NET_GATEWAY3](#) (1)
Configure the 4th byte of the gateway address.
- #define [BOOT_COM_NET_DEFERRED_INIT_ENABLE](#) (1)
Enable/disable the deferred initialization mechanism. When enabled, the communication interface is only initialized when: (a) no valid user program is detected, or (b) when [CpuUserProgramStartHook\(\)](#) returns BLT_FALSE. Your bootloader application can explicitly initialize the communication interface by calling [ComDeferredInit\(\)](#).
- #define [BOOT_COM_RS232_ENABLE](#) (1)
Enable/disable UART transport layer.
- #define [BOOT_COM_RS232_BAUDRATE](#) (57600)
Configure the desired communication speed.
- #define [BOOT_COM_RS232_TX_MAX_DATA](#) (64)
Configure number of bytes in the target->host data packet.
- #define [BOOT_COM_RS232_RX_MAX_DATA](#) (64)
Configure number of bytes in the host->target data packet.
- #define [BOOT_COM_RS232_CHANNEL_INDEX](#) (2)
Select the desired UART peripheral as a zero based index.
- #define [BOOT_BACKDOOR_HOOKS_ENABLE](#) (0)
Enable/disable the backdoor override hook functions.
- #define [BOOT_NVM_HOOKS_ENABLE](#) (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define [BOOT_NVM_SIZE_KB](#) (2048)
Configure the size of the default memory device (typically flash EEPROM).
- #define [BOOT_NVM_CHECKSUM_HOOKS_ENABLE](#) (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x1F8)
This microcontroller has a larger vector table then the default STM32F7xx project as assumed in the bootloader's core. This means the user program has a different checksum location, because this one is added at the end of the user program's vector table.
- #define [BOOT_COP_HOOKS_ENABLE](#) (1)
Enable/disable the hook functions for controlling the watchdog.

- `#define BOOT_COM_CAN_TX_MSG_ID (0x7E1 /*| 0x80000000*/)`
Configure CAN message ID target->host.
- `#define BOOT_COM_CAN_TX_MAX_DATA (8)`
Configure number of bytes in the target->host CAN message.
- `#define BOOT_COM_CAN_RX_MSG_ID (0x667 /*| 0x80000000*/)`
Configure CAN message ID host->target.
- `#define BOOT_COM_CAN_RX_MAX_DATA (8)`
Configure number of bytes in the host->target CAN message.
- `#define BOOT_COM_CAN_CHANNEL_INDEX (0)`
Select the desired CAN peripheral as a zero based index.
- `#define BOOT_COM_RS232_ENABLE (0)`
Enable/disable UART transport layer.
- `#define BOOT_COM_RS232_BAUDRATE (57600)`
Configure the desired communication speed.
- `#define BOOT_COM_RS232_TX_MAX_DATA (64)`
Configure number of bytes in the target->host data packet.
- `#define BOOT_COM_RS232_RX_MAX_DATA (64)`

- *Configure number of bytes in the host->target data packet.*
- `#define BOOT_COM_RS232_CHANNEL_INDEX (0)`
Select the desired UART peripheral as a zero based index.
- `#define BOOT_BACKDOOR_HOOKS_ENABLE (0)`
Enable/disable the backdoor override hook functions.
- `#define BOOT_NVM_HOOKS_ENABLE (0)`
Enable/disable the NVM hook function for supporting additional memory devices.
- `#define BOOT_NVM_SIZE_KB (128)`
Configure the size of the default memory device (typically flash EEPROM).
- `#define BOOT_NVM_CHECKSUM_HOOKS_ENABLE (0)`
Enable/disable hooks functions to override the user program checksum handling.
- `#define BOOT_COP_HOOKS_ENABLE (1)`
Enable/disable the hook functions for controlling the watchdog.

7.155.1 Detailed Description

Bootloader configuration header file.

7.156 blt_conf.h File Reference

Bootloader configuration header file.

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_CPU_XTAL_SPEED_KHZ (8000)`
Frequency of the external crystal oscillator.
- `#define BOOT_CPU_SYSTEM_SPEED_KHZ (24000)`
Desired system speed.
- `#define BOOT_CPU_BYTE_ORDER_MOTOROLA (1)`
Motorola or Intel style byte ordering.
- `#define BOOT_CPU_USER_PROGRAM_START_HOOK (0)`
Enable/disable hook function call right before user program start.
- `#define BOOT_COM_CAN_ENABLE (1)`
Enable/disable CAN transport layer.
- `#define BOOT_COM_CAN_BAUDRATE (500000)`
Configure the desired CAN baudrate.
- `#define BOOT_COM_CAN_TX_MSG_ID (0x7E1 /*| 0x80000000*/)`
Configure CAN message ID target->host.
- `#define BOOT_COM_CAN_TX_MAX_DATA (8)`
Configure number of bytes in the target->host CAN message.
- `#define BOOT_COM_CAN_RX_MSG_ID (0x667 /*| 0x80000000*/)`
Configure CAN message ID host->target.

- #define `BOOT_COM_CAN_RX_MAX_DATA` (8)
Configure number of bytes in the host->target CAN message.
- #define `BOOT_COM_CAN_CHANNEL_INDEX` (0)
Select the desired CAN peripheral as a zero based index.
- #define `BOOT_COM_RS232_ENABLE` (1)
Enable/disable UART transport layer.
- #define `BOOT_COM_RS232_BAUDRATE` (57600)
Configure the desired communication speed.
- #define `BOOT_COM_RS232_TX_MAX_DATA` (64)
Configure number of bytes in the target->host data packet.
- #define `BOOT_COM_RS232_RX_MAX_DATA` (64)
Configure number of bytes in the host->target data packet.
- #define `BOOT_COM_RS232_CHANNEL_INDEX` (0)
Select the desired UART peripheral as a zero based index.
- #define `BOOT_FILE_SYS_ENABLE` (0)
Enable/disable support for firmware updates from a locally attached storage.
- #define `BOOT_FILE_LOGGING_ENABLE` (0)
Enable/disable logging messages during firmware updates.
- #define `BOOT_FILE_ERROR_HOOK_ENABLE` (0)
Enable/disable a hook function that is called upon detection of an error.
- #define `BOOT_FILE_STARTED_HOOK_ENABLE` (0)
Enable/disable a hook function that is called at the start of the update.
- #define `BOOT_FILE_COMPLETED_HOOK_ENABLE` (0)
Enable/disable a hook function that is called at the end of the update.
- #define `BOOT_BACKDOOR_HOOKS_ENABLE` (0)
Enable/disable the backdoor override hook functions.
- #define `BOOT_NVM_HOOKS_ENABLE` (0)
Enable/disable the NVM hook function for supporting additional memory devices.
- #define `BOOT_NVM_SIZE_KB` (256)
Configure the size of the default memory device (typically flash EEPROM).
- #define `BOOT_NVM_CHECKSUM_HOOKS_ENABLE` (0)
Enable/disable hooks functions to override the user program checksum handling.
- #define `BOOT_COP_HOOKS_ENABLE` (0)
Enable/disable the hook functions for controlling the watchdog.

7.156.1 Detailed Description

Bootloader configuration header file.

7.157 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/_template/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

7.157.1 Detailed Description

Demo program bootloader interface source file.

7.157.2 Function Documentation

7.157.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest(), and NetApp().

7.157.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by AppTask(), and main().

7.157.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

Referenced by AppInit(), and main().

7.157.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.157.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.157.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

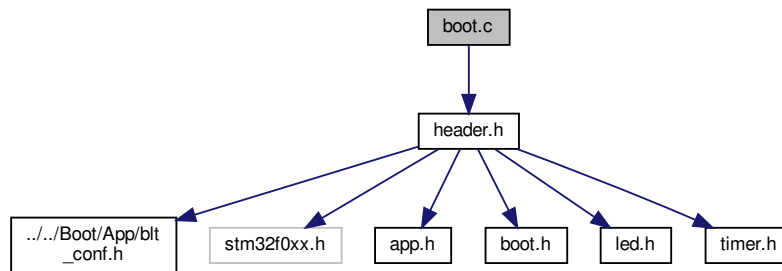

Referenced by BootComRs232CheckActivationRequest().

7.158 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32F0_Discovery_STM32F051_CubeIDE/Prog/App/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.158.1 Detailed Description

Demo program bootloader interface source file.

7.158.2 Function Documentation

7.158.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.158.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.158.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.158.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.158.2.5 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.158.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

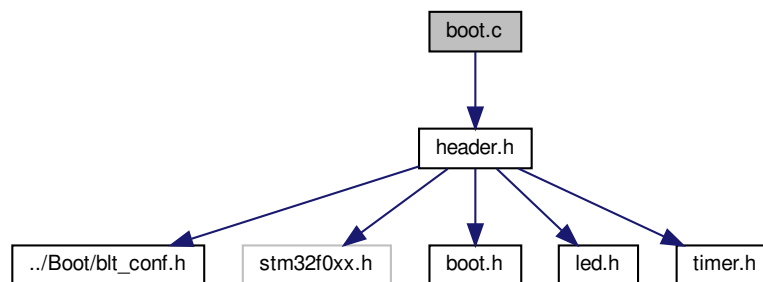

Referenced by BootComRs232CheckActivationRequest().

7.159 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32F0_Discovery_STM32F051_GCC/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.159.1 Detailed Description

Demo program bootloader interface source file.

7.159.2 Function Documentation

7.159.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.159.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.159.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.159.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.159.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.159.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.160 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32F0_Discovery_STM32F051_IAR/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.160.1 Detailed Description

Demo program bootloader interface source file.

7.160.2 Function Documentation

7.160.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.160.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.160.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.160.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.160.2.5 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.160.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.161 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32F0_Discovery_STM32F051_Keil/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

UART handle to be used in API calls.

7.161.1 Detailed Description

Demo program bootloader interface source file.

7.161.2 Function Documentation

7.161.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.161.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.161.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.161.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.161.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.161.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

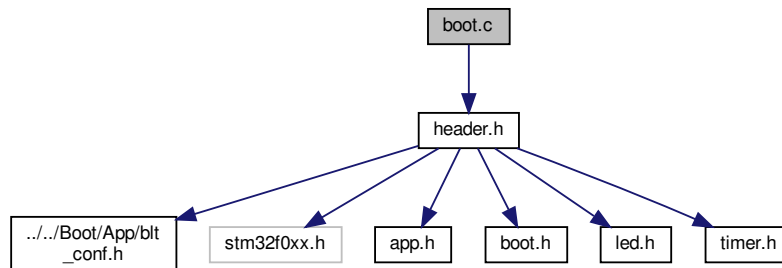

Referenced by BootComRs232CheckActivationRequest().

Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.162.1 Detailed Description

Demo program bootloader interface source file.

7.162.2 Function Documentation

7.162.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.162.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.162.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.162.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.162.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.162.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.162.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.162.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.162.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.162.3 Variable Documentation**7.162.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by `CanGetSpeedConfig()`.

7.163 boot.c File Reference

Demo program bootloader interface source file.

7.163.1 Detailed Description

Demo program bootloader interface source file.

7.163.2 Function Documentation

7.163.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.163.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.163.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.163.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.163.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.163.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.163.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.163.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.163.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.163.3 Variable Documentation**7.163.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

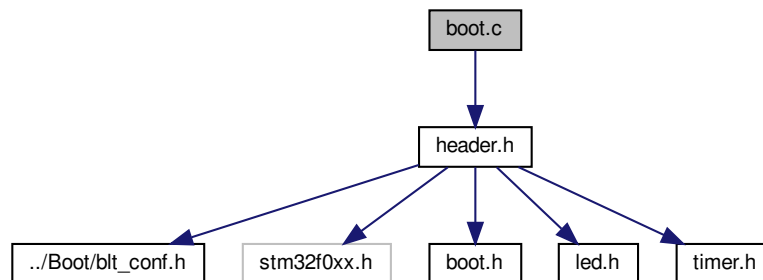

Referenced by `CanGetSpeedConfig()`.

7.164 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32F0_Nucleo_F091RC_IAR/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.164.1 Detailed Description

Demo program bootloader interface source file.

7.164.2 Function Documentation

7.164.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.164.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.164.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.164.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.164.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.164.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.164.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.164.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.164.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.164.3 Variable Documentation

7.164.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by `CanGetSpeedConfig()`.

7.165 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32F0_Nucleo_F091RC_Keil/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.165.1 Detailed Description

Demo program bootloader interface source file.

7.165.2 Function Documentation

7.165.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.165.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.165.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.165.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.165.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.165.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.165.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.165.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.165.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.165.3 Variable Documentation**7.165.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

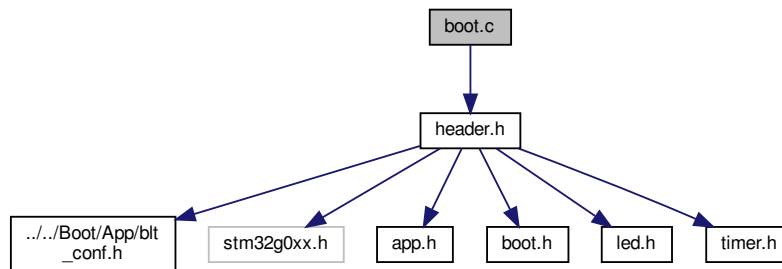

Referenced by `CanGetSpeedConfig()`.

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32G0_Nucleo_G071RB_CubeIDE/Prog/App/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.166.1 Detailed Description

Demo program bootloader interface source file.

7.166.2 Function Documentation

7.166.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.166.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.166.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.166.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.166.2.5 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.166.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.167 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32G0_Nucleo_G071RB_GCC/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

UART handle to be used in API calls.

7.168.1 Detailed Description

Demo program bootloader interface source file.

7.168.2 Function Documentation

7.168.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.168.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.168.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.168.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.168.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.168.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.169 boot.c File Reference

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0_STM32G0_Nucleo_G071RB_Keil/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.169.1 Detailed Description

Demo program bootloader interface source file.

7.169.2 Function Documentation

7.169.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.169.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.169.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.169.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.169.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.169.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.170 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
#include "xmc_gpio.h"
#include "xmc_uart.h"
#include "xmc_can.h"
```

Include dependency graph for Demo/ARMCM0_XMC1_XMC1400_Boot_Kit_GCC/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void `BootComCanInit` (void)
Initializes the CAN communication interface.
- static void `BootComCanCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static XMC_CAN_MO_t [receiveMsgObj](#)
Receive message object data structure.

7.170.1 Detailed Description

Demo program bootloader interface source file.

7.170.2 Function Documentation

7.170.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.170.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.170.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.170.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.170.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.170.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.170.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.170.2.8 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.171 boot.c File Reference

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static XMC_CAN_MO_t `receiveMsgObj`
Receive message object data structure.

7.171.1 Detailed Description

Demo program bootloader interface source file.

7.171.2 Function Documentation

7.171.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.171.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.171.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.171.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.171.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.171.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.171.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.171.2.8 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.172 boot.c File Reference

CAN handle to be used in API calls.

7.172.1 Detailed Description

Demo program bootloader interface source file.

7.172.2 Function Documentation

7.172.2.1 [BootActivate\(\)](#)

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.172.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.172.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.172.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.172.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.172.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.172.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.172.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.172.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.172.3 Variable Documentation**7.172.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
```

```

    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.173.1 Detailed Description

Demo program bootloader interface source file.

7.173.2 Function Documentation

7.173.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.173.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.173.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.173.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.173.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.173.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.173.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.173.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.173.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.173.3 Variable Documentation**7.173.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
}
```

```

7.174.1 Detailed Description

Demo program bootloader interface source file.

7.174.2 Function Documentation

7.174.2.1 [BootActivate\(\)](#)

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.174.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.174.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.174.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.174.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.174.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.174.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.174.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.174.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.174.3 Variable Documentation**7.174.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
```

```

    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.175 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM33_STM32L5_Nucleo_L552ZE_Keil/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [RS232_CTO_RX_PACKET_TIMEOUT_MS](#) (100u)
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static FDCAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.175.1 Detailed Description

Demo program bootloader interface source file.

7.175.2 Function Documentation

7.175.2.1 [BootActivate\(\)](#)

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.175.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.175.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.175.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.175.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.175.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.175.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.175.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.175.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.175.3 Variable Documentation**7.175.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
}
```

```

{ 9, 3 },
{ 9, 4 },
{ 10, 4 },
{ 11, 4 },
{ 12, 4 },
{ 12, 5 },
{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.176 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3_EFM32_Olimex_EM32G880F128STK_GCC/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)

Initializes the communication interface.

- void [BootComCheckActivationRequest](#) (void)

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

- void [BootActivate](#) (void)

Bootloader activation function.

- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)

Receives a communication interface byte if one is present.

7.176.1 Detailed Description

Demo program bootloader interface source file.

7.176.2 Function Documentation

7.176.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComRs232CheckActivationRequest\(\)](#).

7.176.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.176.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.176.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.176.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.176.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.177 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3_EFM32_Olimex_EM32G880F128STK_IAR/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

7.177.1 Detailed Description

Demo program bootloader interface source file.

7.177.2 Function Documentation

7.177.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.177.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.177.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.177.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.177.2.5 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.177.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.178.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.178.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.178.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.178.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.178.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.178.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.179 boot.c File Reference

Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.

7.179.1 Detailed Description

Demo program bootloader interface source file.

7.179.2 Function Documentation

7.179.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComRs232CheckActivationRequest\(\)](#).

7.179.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.179.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.179.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.179.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.179.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.180 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3_LM3S_EK_LM3S8962_GCC/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.
- `#define CAN_RX_MSGOBJECT_IDX (0)`
Index of the used reception message object.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void `BootComCanInit` (void)
Initializes the CAN communication interface.
- static void `BootComCanCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char `CanSetBittiming` (void)
*Attempts to match the bittiming parameters to the requested baudrate for a sample point between 65 and 75%, through a linear search algorithm. It is based on the equation: baudrate = CAN Clock Freq/((1+PropSeg+Phase1↔Seg+Phase2Seg)*Prescaler)*

Variables

- static const unsigned short `canBitNum2Mask []`
Lookup table to quickly and efficiently convert a bit number to a bit mask.

7.180.1 Detailed Description

Demo program bootloader interface source file.

7.180.2 Function Documentation

7.180.2.1 `BootActivate()`

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.180.2.2 `BootComCanCheckActivationRequest()`

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by `BootComCheckActivationRequest()`.

7.180.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.180.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.180.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.180.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.180.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.180.2.8 CanSetBittiming()

```
static unsigned char CanSetBittiming (
    void ) [static]
```

Attempts to match the bittiming parameters to the requested baudrate for a sample point between 65 and 75%, through a linear search algorithm. It is based on the equation: baudrate = CAN Clock Freq/((1+PropSeg+Phase1↔Seg+Phase2Seg)*Prescaler)

Returns

1 if a valid bittiming configuration was found and set. 0 otherwise.

Referenced by BootComCanInit().

7.180.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.181.1 Detailed Description

Demo program bootloader interface source file.

7.181.2 Function Documentation

7.181.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComCanCheckActivationRequest(), and BootComRs232CheckActivationRequest().

7.181.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.181.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.181.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.181.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.181.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.181.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.181.2.8 CanSetBittiming()

```
static unsigned char CanSetBittiming (
    void ) [static]
```

Attempts to match the bittiming parameters to the requested baudrate for a sample point between 65 and 75%, through a linear search algorithm. It is based on the equation: baudrate = CAN Clock Freq/((1+PropSeg+Phase1↵Seg+Phase2Seg)*Prescaler)

Returns

1 if a valid bittiming configuration was found and set. 0 otherwise.

Referenced by BootComCanInit().

7.181.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

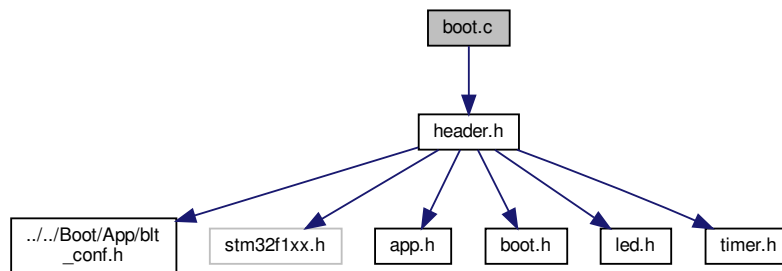

Referenced by BootComRs232CheckActivationRequest().

7.182 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3_STM32F1_Nucleo_F103RB_CubeIDE/Prog/App/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.182.1 Detailed Description

Demo program bootloader interface source file.

7.182.2 Function Documentation

7.182.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.182.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.182.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.182.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.182.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.182.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.183 boot.c File Reference

- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.183.1 Detailed Description

Demo program bootloader interface source file.

7.183.2 Function Documentation

7.183.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.183.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.183.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.183.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.183.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.183.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.184 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3_STM32F1_Nucleo_F103RB_IAR/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static UART_HandleTypeDef `rs232Handle`
UART handle to be used in API calls.

7.184.1 Detailed Description

Demo program bootloader interface source file.

7.184.2 Function Documentation

7.184.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComRs232CheckActivationRequest().

7.184.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.184.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.184.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.184.2.5 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.184.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.185 boot.c File Reference

7.186.1 Detailed Description

Demo program bootloader interface source file.

7.186.2 Function Documentation

7.186.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.186.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.186.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.186.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.186.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.186.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.186.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.186.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.186.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.186.3 Variable Documentation

7.186.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
    { 9, 3 },  
    { 9, 4 },  
    { 10, 4 },  
    { 11, 4 },  
    { 12, 4 },  
    { 12, 5 },  
    { 13, 5 },  
    { 14, 5 },  
    { 15, 5 },  
    { 15, 6 },  
    { 16, 6 },  
    { 16, 7 },  
    { 16, 8 }  
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by `CanGetSpeedConfig()`.

7.187 boot.c File Reference

7.187.1 Detailed Description

Demo program bootloader interface source file.

7.187.2 Function Documentation

7.187.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.187.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.187.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.187.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.187.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.187.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.187.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.187.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.187.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.187.3 Variable Documentation**7.187.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },

7.188.1 Detailed Description

Demo program bootloader interface source file.

7.188.2 Function Documentation

7.188.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.188.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.188.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.188.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.188.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.188.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.188.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.188.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.188.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.188.3 Variable Documentation**7.188.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.189.1 Detailed Description

Demo program bootloader interface source file.

7.189.2 Function Documentation

7.189.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.189.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.189.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.189.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.189.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.189.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.189.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.189.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.189.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.189.3 Variable Documentation**7.189.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
    { 9, 3 },  
    { 9, 4 },  
    { 10, 4 },  
    { 11, 4 },  
    { 12, 4 },  
    { 12, 5 },  
    { 13, 5 },  
    { 14, 5 },  
    { 15, 5 },  
    { 15, 6 },  
    { 16, 6 },  
    { 16, 7 },  
    { 16, 8 }  
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

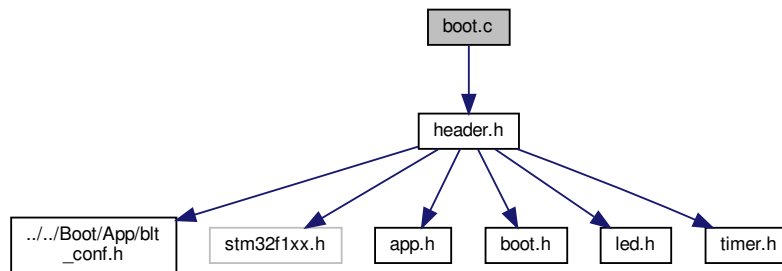

Referenced by `CanGetSpeedConfig()`.

7.190 boot.c File Reference

Demo program bootloader interface source file.

7.190.1 Detailed Description

Demo program bootloader interface source file.

7.190.2 Function Documentation

7.190.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComCanCheckActivationRequest().

7.190.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.190.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.190.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.190.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.190.2.6 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.194.1 Detailed Description

Demo program bootloader interface source file.

7.194.2 Function Documentation

7.194.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComCanCheckActivationRequest(), and BootComRs232CheckActivationRequest().

7.194.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.194.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.194.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.194.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.194.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.194.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.194.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.194.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.194.3 Variable Documentation

7.194.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

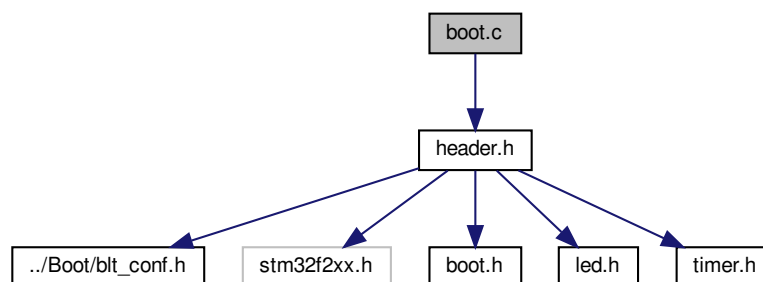

Referenced by CanGetSpeedConfig().

7.195.1 Detailed Description

Demo program bootloader interface source file.

7.195.2 Function Documentation

7.195.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.195.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by `BootComCheckActivationRequest()`.

7.195.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by `BootComInit()`.

7.195.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.195.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.195.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.195.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.195.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.195.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.195.3 Variable Documentation

7.195.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },

7.196.1 Detailed Description

Demo program bootloader interface source file.

7.196.2 Function Documentation

7.196.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by BootComCanCheckActivationRequest(), and BootComRs232CheckActivationRequest().

7.196.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.196.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.196.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.196.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.196.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.196.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.196.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.196.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.196.3 Variable Documentation

7.196.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. 7.197.1 Detailed Description

Demo program bootloader interface source file.

7.197.2 Function Documentation

7.197.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.197.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by `BootComCheckActivationRequest()`.

7.197.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by `BootComInit()`.

7.197.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.197.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.197.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.197.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.197.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.197.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.197.3 Variable Documentation

7.197.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.198 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4_S32K14_S32K144EVB_GCC/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)

Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS` (100u)
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.
- `#define LPUARTx` (LPUART1)
Set the peripheral LPUART base pointer.
- `#define PCC_LPUARTx_INDEX` (PCC_LPUART1_INDEX)
Set the PCC index offset for LPUART.
- `#define CAN_INIT_TIMEOUT_MS` (250U)
Timeout for entering/leaving CAN initialization mode in milliseconds.
- `#define CANx` (CAN0)
Set the peripheral CAN0 base pointer.
- `#define PCC_FlexCANx_INDEX` (PCC_FlexCAN0_INDEX)
Set the PCC index offset for CAN0.
- `#define CANx_MAX_MB_NUM` (FEATURE_CAN0_MAX_MB_NUM)
Set the number of message boxes supported by CAN0.
- `#define CAN_RX_MSGBOX_NUM` (9U)
The mailbox used for receiving the XCP command message.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void `BootComCanInit` (void)
Initializes the CAN communication interface.
- static void `BootComCanCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char `CanGetSpeedConfig` (unsigned short baud, unsigned short *prescaler, tCanBusTiming *busTimingCfg)
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- static void `CanFreezeModeEnter` (void)
Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.
- static void `CanFreezeModeExit` (void)
Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.
- static void `CanDisabledModeEnter` (void)
Places the CAN controller in disabled mode.
- static void `CanDisabledModeExit` (void)
Places the CAN controller in enabled mode.

Variables

- static const `tCanBusTiming canTiming []`
CAN bit timing table for dynamically calculating the bittiming settings.
- static volatile unsigned long `dummyTimerVal`
Dummy variable to store the CAN controller's free running timer value in. This is needed at the end of a CAN message reception to unlock the mailbox again. If this variable is declared locally within the function, it generates an unwanted compiler warning about assigning a value and not using it. For this reason this dummy variable is declare here as a module global.

7.198.1 Detailed Description

Demo program bootloader interface source file.

7.198.2 Function Documentation

7.198.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.198.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by `BootComCheckActivationRequest()`.

7.198.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.198.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.198.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.198.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.198.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.198.2.8 CanDisabledModeEnter()

```
static void CanDisabledModeEnter (  
    void ) [static]
```

Places the CAN controller in disabled mode.

Returns

none.

Referenced by BootComCanInit().

7.198.2.9 CanDisabledModeExit()

```
static void CanDisabledModeExit (  
    void ) [static]
```

Places the CAN controller in enabled mode.

Returns

none.

Referenced by BootComCanInit().

7.198.2.10 CanFreezeModeEnter()

```
static void CanFreezeModeEnter (
    void ) [static]
```

Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.

Returns

none.

Referenced by BootComCanInit().

7.198.2.11 CanFreezeModeExit()

```
static void CanFreezeModeExit (
    void ) [static]
```

Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.

Returns

none.

Referenced by BootComCanInit().

7.198.2.12 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    tCanBusTiming * busTimingCfg ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>busTimingCfg</i>	Pointer to where the bus timing values will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by `BootComCanInit()`.

7.198.2.13 `Rs232ReceiveByte()`

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.198.3 Variable Documentation

7.198.3.1 `canTiming`

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 8U, 3U, 2U, 2U },
    { 9U, 3U, 3U, 2U },
    { 10U, 3U, 3U, 3U },
    { 11U, 4U, 3U, 3U },
    { 12U, 4U, 4U, 3U },
    { 13U, 5U, 4U, 3U },
    { 14U, 5U, 4U, 4U },
    { 15U, 6U, 4U, 4U },
    { 16U, 6U, 5U, 4U },
    { 17U, 7U, 5U, 4U },
    { 18U, 7U, 5U, 5U },
    { 19U, 8U, 5U, 5U },
    { 20U, 8U, 6U, 5U },
    { 21U, 8U, 7U, 5U },
    { 22U, 8U, 7U, 6U },
    { 23U, 8U, 8U, 6U },
    { 24U, 8U, 8U, 7U },
    { 25U, 8U, 8U, 8U }
}
```

CAN bit timing table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + TSEG2)

- 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%. A visual representation of the TQ in a bit is: | SYNCSEG | TIME1SEG | TIME2SEG | Or with an alternative representation: | SYNCSEG | PROPSEG | PHASE1SEG | PHASE2SEG | With the alternative representation TIME1SEG = PROPSEG + PHASE1SEG.

Referenced by CanGetSpeedConfig().

7.199 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4_S32K14_S32K144EVB_IAR/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- [#define RS232_CTO_RX_PACKET_TIMEOUT_MS](#) (100u)
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.
- [#define LPUARTx](#) (LPUART1)
Set the peripheral LPUART base pointer.
- [#define PCC_LPUARTx_INDEX](#) (PCC_LPUART1_INDEX)
Set the PCC index offset for LPUART.
- [#define CAN_INIT_TIMEOUT_MS](#) (250U)
Timeout for entering/leaving CAN initialization mode in milliseconds.
- [#define CANx](#) (CAN0)
Set the peripheral CAN0 base pointer.
- [#define PCC_FlexCANx_INDEX](#) (PCC_FlexCAN0_INDEX)
Set the PCC index offset for CAN0.
- [#define CANx_MAX_MB_NUM](#) (FEATURE_CAN0_MAX_MB_NUM)
Set the number of message boxes supported by CAN0.
- [#define CAN_RX_MSGBOX_NUM](#) (9U)
The mailbox used for receiving the XCP command message.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, [tCanBusTiming](#) *busTimingCfg)
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- static void [CanFreezeModeEnter](#) (void)
Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.
- static void [CanFreezeModeExit](#) (void)
Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.
- static void [CanDisabledModeEnter](#) (void)
Places the CAN controller in disabled mode.
- static void [CanDisabledModeExit](#) (void)
Places the CAN controller in enabled mode.

Variables

- static const [tCanBusTiming](#) [canTiming](#) []
CAN bit timing table for dynamically calculating the bittiming settings.
- static volatile unsigned long [dummyTimerVal](#)
Dummy variable to store the CAN controller's free running timer value in. This is needed at the end of a CAN message reception to unlock the mailbox again. If this variable is declared locally within the function, it generates an unwanted compiler warning about assigning a value and not using it. For this reason this dummy variable is declare here as a module global.

7.199.1 Detailed Description

Demo program bootloader interface source file.

7.199.2 Function Documentation

7.199.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.199.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by `BootComCheckActivationRequest()`.

7.199.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by `BootComInit()`.

7.199.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.199.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.199.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.199.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.199.2.8 CanDisabledModeEnter()

```
static void CanDisabledModeEnter (  
    void ) [static]
```

Places the CAN controller in disabled mode.

Returns

none.

Referenced by BootComCanInit().

7.199.2.9 CanDisabledModeExit()

```
static void CanDisabledModeExit (  
    void ) [static]
```

Places the CAN controller in enabled mode.

Returns

none.

Referenced by BootComCanInit().

7.199.2.10 CanFreezeModeEnter()

```
static void CanFreezeModeEnter (  
    void ) [static]
```

Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.

Returns

none.

Referenced by BootComCanInit().

7.199.2.11 CanFreezeModeExit()

```
static void CanFreezeModeExit (
    void ) [static]
```

Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.

Returns

none.

Referenced by BootComCanInit().

7.199.2.12 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    tCanBusTiming * busTimingCfg ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>busTimingCfg</i>	Pointer to where the bus timing values will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.199.2.13 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.199.3 Variable Documentation**7.199.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 8U, 3U, 2U, 2U },
    { 9U, 3U, 3U, 2U },
    { 10U, 3U, 3U, 3U },
    { 11U, 4U, 3U, 3U },
    { 12U, 4U, 4U, 3U },
    { 13U, 5U, 4U, 3U },
    { 14U, 5U, 4U, 4U },
    { 15U, 6U, 4U, 4U },
    { 16U, 6U, 5U, 4U },
    { 17U, 7U, 5U, 4U },
    { 18U, 7U, 5U, 5U },
    { 19U, 8U, 5U, 5U },
    { 20U, 8U, 6U, 5U },
    { 21U, 8U, 7U, 5U },
    { 22U, 8U, 7U, 6U },
    { 23U, 8U, 8U, 6U },
    { 24U, 8U, 8U, 7U },
    { 25U, 8U, 8U, 8U }
}
```

CAN bit timing table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + TSEG2)

- 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%. 7.200.1 Detailed Description

Demo program bootloader interface source file.

7.200.2 Function Documentation

7.200.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.200.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.200.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.200.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.200.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.200.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.200.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.200.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.200.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.200.3 Variable Documentation**7.200.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

7.201.1 Detailed Description

Demo program bootloader interface source file.

7.201.2 Function Documentation

7.201.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.201.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.201.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.201.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.201.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.201.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.201.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.201.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.201.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.201.3 Variable Documentation**7.201.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

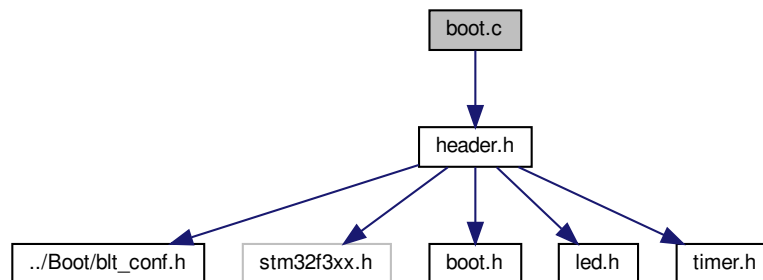

Referenced by `CanGetSpeedConfig()`.

Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.202.1 Detailed Description

Demo program bootloader interface source file.

7.202.2 Function Documentation

7.202.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.202.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.202.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.202.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.202.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.202.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.202.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.202.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.202.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.202.3 Variable Documentation**7.202.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
    { 9, 3 },  
    { 9, 4 },  
    { 10, 4 },  
    { 11, 4 },  
    { 12, 4 },  
    { 12, 5 },  
    { 13, 5 },  
    { 14, 5 },  
    { 15, 5 },  
    { 15, 6 },  
    { 16, 6 },  
    { 16, 7 },  
    { 16, 8 }  
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

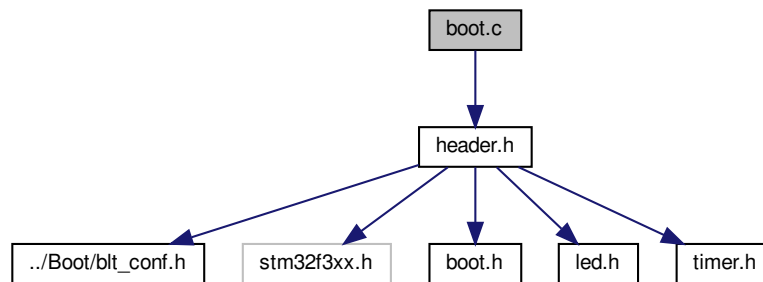

Referenced by `CanGetSpeedConfig()`.

7.203 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4_STM32F3_Nucleo_F303K8_Keil/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

7.203.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.203.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.203.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.203.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.203.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.203.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.203.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

7.204.1 Detailed Description

Demo program bootloader interface source file.

7.204.2 Function Documentation

7.204.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.204.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.204.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.204.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.204.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.204.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.204.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.204.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.204.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.204.3 Variable Documentation**7.204.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },

7.205.1 Detailed Description

Demo program bootloader interface source file.

7.205.2 Function Documentation

7.205.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.205.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.205.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.205.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.205.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.205.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.205.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.205.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.205.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.205.3 Variable Documentation**7.205.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.206.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.206.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.206.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.206.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.206.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.206.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.206.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.206.3 Variable Documentation**7.206.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by `CanGetSpeedConfig()`.

7.207 boot.c File Reference

Demo program bootloader interface source file.

7.207.1 Detailed Description

Demo program bootloader interface source file.

7.207.2 Function Documentation

7.207.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.207.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.207.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.207.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.207.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.207.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.207.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.207.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.207.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.207.3 Variable Documentation**7.207.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },

7.210.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.210.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.210.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.210.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.210.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.210.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.210.3 Variable Documentation**7.210.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by `CanGetSpeedConfig()`.

7.211 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4_STM32F4_Olimex_STM32P405_Keil/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.

CAN handle to be used in API calls.

7.211.1 Detailed Description

Demo program bootloader interface source file.

7.211.2 Function Documentation

7.211.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.211.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.211.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.211.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.211.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.211.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.211.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.211.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.211.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.211.3 Variable Documentation

7.211.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

7.212.1 Detailed Description

Demo program bootloader interface source file.

7.212.2 Function Documentation

7.212.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.212.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.212.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.212.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.212.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.212.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.212.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.212.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.212.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

7.214.1 Detailed Description

Demo program bootloader interface source file.

7.214.2 Function Documentation

7.214.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.214.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.214.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.214.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.214.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.214.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.214.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.214.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.214.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.214.3 Variable Documentation**7.214.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=

#include "header.h"
```

Include dependency graph for Demo/ARMCM4_STM32L4_Nucleo_L476RG_Keil/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.
- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)
Receives a communication interface byte if one is present.
- static unsigned char [CanGetSpeedConfig](#) (unsigned short baud, unsigned short *prescaler, unsigned char *tseg1, unsigned char *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.

Variables

- static UART_HandleTypeDef [rs232Handle](#)
UART handle to be used in API calls.
- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.215.1 Detailed Description

Demo program bootloader interface source file.

7.215.2 Function Documentation

7.215.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.215.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.215.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.215.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.215.2.5 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.215.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.215.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.215.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (  
    unsigned short baud,  
    unsigned short * prescaler,  
    unsigned char * tseg1,  
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.215.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootComInit` (void)
Initializes the communication interface.
- void `BootComCheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

7.216.1 Detailed Description

Demo program bootloader interface source file.

7.216.2 Function Documentation

7.216.2.1 `BootActivate()`

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComRs232CheckActivationRequest()`.

7.216.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.216.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.216.2.4 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.216.2.5 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.216.2.6 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

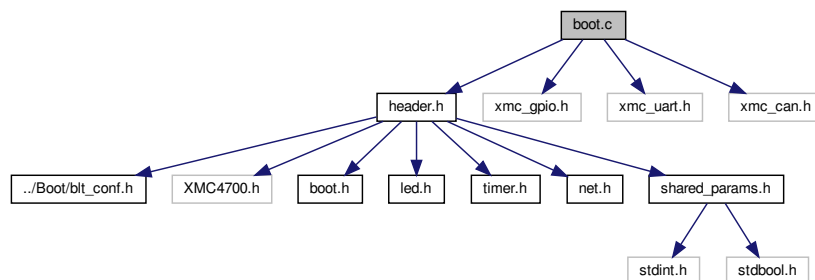

Referenced by `BootComRs232CheckActivationRequest()`.

7.217 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
#include "xmc_gpio.h"
#include "xmc_uart.h"
#include "xmc_can.h"
```

Include dependency graph for Demo/ARMCM4_XMC4_XMC4700_Relax_Kit_GCC/Prog/boot.c:

Macros

- `#define RS232_CTO_RX_PACKET_TIMEOUT_MS (100u)`
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void `BootComRs232Init` (void)
Initializes the UART communication interface.
- static void `BootComRs232CheckActivationRequest` (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void `BootComCanInit` (void)
Initializes the CAN communication interface.
- static void `BootComCanCheckActivationRequest` (void)

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

- void [BootComInit](#) (void)

Initializes the communication interface.

- void [BootComCheckActivationRequest](#) (void)

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

- void [BootActivate](#) (void)

Bootloader activation function.

- static unsigned char [Rs232ReceiveByte](#) (unsigned char *data)

Receives a communication interface byte if one is present.

Variables

- static XMC_CAN_MO_t [receiveMsgObj](#)

Receive message object data structure.

7.217.1 Detailed Description

Demo program bootloader interface source file.

7.217.2 Function Documentation

7.217.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.217.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by [BootComCheckActivationRequest\(\)](#).

7.217.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.217.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.217.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.217.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.217.2.7 BootComRs232Init()

```
static void BootComRs232Init (  
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.217.2.8 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.218 boot.c File Reference

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void `BootActivate` (void)
Bootloader activation function.
- static unsigned char `Rs232ReceiveByte` (unsigned char *data)
Receives a communication interface byte if one is present.

Variables

- static XMC_CAN_MO_t `receiveMsgObj`
Receive message object data structure.

7.218.1 Detailed Description

Demo program bootloader interface source file.

7.218.2 Function Documentation

7.218.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by `BootComCanCheckActivationRequest()`, and `BootComRs232CheckActivationRequest()`.

7.218.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by `BootComCheckActivationRequest()`.

7.218.2.3 BootComCanInit()

```
static void BootComCanInit (
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by `BootComInit()`.

7.218.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.218.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.218.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.218.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.218.2.8 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by `BootComRs232CheckActivationRequest()`.

7.219.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.219.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.219.3 Variable Documentation**7.219.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
}
```

```

7.220.1 Detailed Description

Demo program bootloader interface source file.

7.220.2 Function Documentation

7.220.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.220.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.220.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.220.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.220.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.220.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.220.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.220.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.220.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.220.3 Variable Documentation**7.220.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
```

```

    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.221 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM7_STM32F7_Nucleo_F746ZG_IAR/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [RS232_CTO_RX_PACKET_TIMEOUT_MS](#) (100u)
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

- static void [BootComRs232Init](#) (void)
Initializes the UART communication interface.
- static void [BootComRs232CheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- static void [BootComCanInit](#) (void)
Initializes the CAN communication interface.
- static void [BootComCanCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

CAN handle to be used in API calls.

7.221.1 Detailed Description

Demo program bootloader interface source file.

7.221.2 Function Documentation

7.221.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.221.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.221.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.221.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.221.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.221.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.221.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.221.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.221.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.221.3 Variable Documentation**7.221.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
}
```

```

    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. 7.222.1 Detailed Description

Demo program bootloader interface source file.

7.222.2 Function Documentation

7.222.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.222.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.222.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.222.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.222.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.222.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.222.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.222.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.222.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.222.3 Variable Documentation**7.222.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
```

```

{ 9, 3 },
{ 9, 4 },
{ 10, 4 },
{ 11, 4 },
{ 12, 4 },
{ 12, 5 },
{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.227.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.227.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.227.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.227.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.227.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.227.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.227.3 Variable Documentation**7.227.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
}
```

```

{ 9, 3 },
{ 9, 4 },
{ 10, 4 },
{ 11, 4 },
{ 12, 4 },
{ 12, 5 },
{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.228 boot.c File Reference

Demo program bootloader interface source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM7_STM32H7_Nucleo_H743ZI_GCC/Prog/boot.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [RS232_CTO_RX_PACKET_TIMEOUT_MS](#) (100u)
Timeout time for the reception of a CTO packet. The timer is started upon reception of the first packet byte.

Functions

CAN handle to be used in API calls.

7.228.1 Detailed Description

Demo program bootloader interface source file.

7.228.2 Function Documentation

7.228.2.1 [BootActivate\(\)](#)

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.228.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.228.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.228.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.228.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.228.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.228.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.228.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.228.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.228.3 Variable Documentation**7.228.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
```

```

7.229.1 Detailed Description

Demo program bootloader interface source file.

7.229.2 Function Documentation

7.229.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.229.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.229.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.229.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.229.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.229.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.229.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.229.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned short * prescaler,
    unsigned char * tseg1,
    unsigned char * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.229.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.229.3 Variable Documentation**7.229.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```

7.231.1 Detailed Description

Demo program bootloader interface source file.

7.231.2 Function Documentation

7.231.2.1 [BootActivate\(\)](#)

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), and [BootComRs232CheckActivationRequest\(\)](#).

7.231.2.2 BootComCanCheckActivationRequest()

```
static void BootComCanCheckActivationRequest (  
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.231.2.3 BootComCanInit()

```
static void BootComCanInit (  
    void ) [static]
```

Initializes the CAN communication interface.

Returns

none.

Referenced by BootComInit().

7.231.2.4 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.231.2.5 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.231.2.6 BootComRs232CheckActivationRequest()

```
static void BootComRs232CheckActivationRequest (
    void ) [static]
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by BootComCheckActivationRequest().

7.231.2.7 BootComRs232Init()

```
static void BootComRs232Init (
    void ) [static]
```

Initializes the UART communication interface.

Returns

none.

Referenced by BootComInit().

7.231.2.8 CanGetSpeedConfig()

```
static unsigned char CanGetSpeedConfig (
    unsigned short baud,
    unsigned char * btr0,
    unsigned char * btr1 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>btr0</i>	Pointer to where the value for register CANxBTR0 will be stored.
<i>btr1</i>	Pointer to where the value for register CANxBTR1 will be stored.

Returns

1 if the CAN bustiming register values were found, 0 otherwise.

Referenced by BootComCanInit().

7.231.2.9 Rs232ReceiveByte()

```
static unsigned char Rs232ReceiveByte (  
    unsigned char * data ) [static]
```

Receives a communication interface byte if one is present.

Parameters

<i>data</i>	Pointer to byte where the data is to be stored.
-------------	---

Returns

1 if a byte was received, 0 otherwise.

Referenced by BootComRs232CheckActivationRequest().

7.231.3 Variable Documentation

7.231.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```

    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
    { 9, 3 },  
}
```

```

{ 9, 4 },
{ 10, 4 },
{ 11, 4 },
{ 12, 4 },
{ 12, 5 },
{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

Array with possible time quanta configurations.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2)

- 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.232 boot.c File Reference

Bootloader core module source file.

```
#include "boot.h"
```

Include dependency graph for Source/boot.c:

Functions

- void **BootInit** (void)
Initializes the bootloader core.
- void **BootTask** (void)
Task function of the bootloader core that drives the program.

7.232.1 Detailed Description

Bootloader core module source file.

7.232.2 Function Documentation

7.232.2.1 BootInit()

```
void BootInit (
    void )
```

Initializes the bootloader core.

Returns

none

Referenced by AppInit(), and main().

7.232.2.2 BootTask()

```
void BootTask (
    void )
```

Task function of the bootloader core that drives the program.

Returns

none

Referenced by AppTask(), and main().

7.233 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.233.1 Detailed Description

Demo program bootloader interface header file.

7.233.2 Function Documentation

7.233.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.233.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.233.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.234 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.234.1 Detailed Description

Demo program bootloader interface header file.

7.234.2 Function Documentation

7.234.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.234.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.234.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.235 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.235.1 Detailed Description

Demo program bootloader interface header file.

7.235.2 Function Documentation

7.235.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.235.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.235.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.236 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.236.1 Detailed Description

Demo program bootloader interface header file.

7.236.2 Function Documentation

7.236.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.236.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.236.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.237 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.237.1 Detailed Description

Demo program bootloader interface header file.

7.237.2 Function Documentation

7.237.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.237.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.237.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.238 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.238.1 Detailed Description

Demo program bootloader interface header file.

7.238.2 Function Documentation

7.238.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.238.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.238.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.239 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.239.1 Detailed Description

Demo program bootloader interface header file.

7.239.2 Function Documentation

7.239.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.239.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.239.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.240 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.240.1 Detailed Description

Demo program bootloader interface header file.

7.240.2 Function Documentation

7.240.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.240.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.240.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.241 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.241.1 Detailed Description

Demo program bootloader interface header file.

7.241.2 Function Documentation

7.241.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.241.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.241.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.242 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.242.1 Detailed Description

Demo program bootloader interface header file.

7.242.2 Function Documentation

7.242.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.242.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.242.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.243 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.243.1 Detailed Description

Demo program bootloader interface header file.

7.243.2 Function Documentation

7.243.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.243.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.243.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.244 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.244.1 Detailed Description

Demo program bootloader interface header file.

7.244.2 Function Documentation

7.244.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.244.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.244.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.245 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.245.1 Detailed Description

Demo program bootloader interface header file.

7.245.2 Function Documentation

7.245.2.1 [BootActivate\(\)](#)

```
void BootActivate (

```

Bootloader activation function.

Returns

none.

7.245.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.245.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.246 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.246.1 Detailed Description

Demo program bootloader interface header file.

7.246.2 Function Documentation

7.246.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.246.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.246.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.247 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.247.1 Detailed Description

Demo program bootloader interface header file.

7.247.2 Function Documentation

7.247.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.247.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.247.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.248 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.248.1 Detailed Description

Demo program bootloader interface header file.

7.248.2 Function Documentation

7.248.2.1 [BootActivate\(\)](#)

```

Demo program bootloader interface header file.

7.249.2 Function Documentation

7.249.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.249.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.249.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.250 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.250.1 Detailed Description

Demo program bootloader interface header file.

7.250.2 Function Documentation

7.250.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.250.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.250.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.251 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.251.1 Detailed Description

Demo program bootloader interface header file.

7.251.2 Function Documentation

7.251.2.1 [BootActivate\(\)](#)

```

Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.256.1 Detailed Description

Demo program bootloader interface header file.

7.256.2 Function Documentation

7.256.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.256.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.256.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.257 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.257.1 Detailed Description

Demo program bootloader interface header file.

7.257.2 Function Documentation

7.257.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.257.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.257.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.258 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.258.1 Detailed Description

Demo program bootloader interface header file.

7.258.2 Function Documentation

7.258.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.258.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.258.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.259 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.259.1 Detailed Description

Demo program bootloader interface header file.

7.259.2 Function Documentation

7.259.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.259.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.259.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.260 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.260.1 Detailed Description

Demo program bootloader interface header file.

7.260.2 Function Documentation

7.260.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.260.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.260.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.261 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.261.1 Detailed Description

Demo program bootloader interface header file.

7.261.2 Function Documentation

7.261.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.261.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.261.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.262 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.262.1 Detailed Description

Demo program bootloader interface header file.

7.262.2 Function Documentation

7.262.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.262.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.262.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.263 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.263.1 Detailed Description

Demo program bootloader interface header file.

7.263.2 Function Documentation

7.263.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.263.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.263.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.264 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.264.1 Detailed Description

Demo program bootloader interface header file.

7.264.2 Function Documentation

7.264.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.264.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.264.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.265 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.265.1 Detailed Description

Demo program bootloader interface header file.

7.265.2 Function Documentation

7.265.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.265.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.265.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.266 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.266.1 Detailed Description

Demo program bootloader interface header file.

7.266.2 Function Documentation

7.266.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.266.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.266.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.267 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.267.1 Detailed Description

Demo program bootloader interface header file.

7.267.2 Function Documentation

7.267.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.267.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.267.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.268 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.268.1 Detailed Description

Demo program bootloader interface header file.

7.268.2 Function Documentation

7.268.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.268.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.268.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.269 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.269.1 Detailed Description

Demo program bootloader interface header file.

7.269.2 Function Documentation

7.269.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.269.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.269.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.270 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.270.1 Detailed Description

Demo program bootloader interface header file.

7.270.2 Function Documentation

7.270.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.270.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.270.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.271 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.271.1 Detailed Description

Demo program bootloader interface header file.

7.271.2 Function Documentation

7.271.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.271.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.271.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.272 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.272.1 Detailed Description

Demo program bootloader interface header file.

7.272.2 Function Documentation

7.272.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.272.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.272.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.273 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.273.1 Detailed Description

Demo program bootloader interface header file.

7.273.2 Function Documentation

7.273.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.273.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.273.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.274 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.274.1 Detailed Description

Demo program bootloader interface header file.

7.274.2 Function Documentation

7.274.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.274.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.274.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.275 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.275.1 Detailed Description

Demo program bootloader interface header file.

7.275.2 Function Documentation

7.275.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.275.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.275.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.276 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.276.1 Detailed Description

Demo program bootloader interface header file.

7.276.2 Function Documentation

7.276.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.276.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.276.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.277 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.277.1 Detailed Description

Demo program bootloader interface header file.

7.277.2 Function Documentation

7.277.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.277.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.277.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.278 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.278.1 Detailed Description

Demo program bootloader interface header file.

7.278.2 Function Documentation

7.278.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.278.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.278.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.279 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.279.1 Detailed Description

Demo program bootloader interface header file.

7.279.2 Function Documentation

7.279.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.279.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.279.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.280 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.280.1 Detailed Description

Demo program bootloader interface header file.

7.280.2 Function Documentation

7.280.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.280.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.280.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.281 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.281.1 Detailed Description

Demo program bootloader interface header file.

7.281.2 Function Documentation

7.281.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.281.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.281.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.282 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.282.1 Detailed Description

Demo program bootloader interface header file.

7.282.2 Function Documentation

7.282.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.282.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.282.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.283 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.283.1 Detailed Description

Demo program bootloader interface header file.

7.283.2 Function Documentation

7.283.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.283.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.283.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.284 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.284.1 Detailed Description

Demo program bootloader interface header file.

7.284.2 Function Documentation

7.284.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.284.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.284.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.285 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.285.1 Detailed Description

Demo program bootloader interface header file.

7.285.2 Function Documentation

7.285.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.285.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.285.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.286 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.286.1 Detailed Description

Demo program bootloader interface header file.

7.286.2 Function Documentation

7.286.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.286.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.286.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.287 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.287.1 Detailed Description

Demo program bootloader interface header file.

7.287.2 Function Documentation

7.287.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.287.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.287.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.288 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.288.1 Detailed Description

Demo program bootloader interface header file.

7.288.2 Function Documentation

7.288.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.288.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.288.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.289 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.289.1 Detailed Description

Demo program bootloader interface header file.

7.289.2 Function Documentation

7.289.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.289.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.289.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.290 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.290.1 Detailed Description

Demo program bootloader interface header file.

7.290.2 Function Documentation

7.290.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.290.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.290.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.291 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.291.1 Detailed Description

Demo program bootloader interface header file.

7.291.2 Function Documentation

7.291.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.291.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.291.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.292 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.292.1 Detailed Description

Demo program bootloader interface header file.

7.292.2 Function Documentation

7.292.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.292.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.292.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.293 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.293.1 Detailed Description

Demo program bootloader interface header file.

7.293.2 Function Documentation

7.293.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.293.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.293.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.294 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.294.1 Detailed Description

Demo program bootloader interface header file.

7.294.2 Function Documentation

7.294.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.294.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.294.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.295 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.295.1 Detailed Description

Demo program bootloader interface header file.

7.295.2 Function Documentation

7.295.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.295.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.295.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.296 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.296.1 Detailed Description

Demo program bootloader interface header file.

7.296.2 Function Documentation

7.296.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.296.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.296.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.297 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.297.1 Detailed Description

Demo program bootloader interface header file.

7.297.2 Function Documentation

7.297.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.297.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.297.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.298 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.298.1 Detailed Description

Demo program bootloader interface header file.

7.298.2 Function Documentation

7.298.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.298.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.298.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.299 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.299.1 Detailed Description

Demo program bootloader interface header file.

7.299.2 Function Documentation

7.299.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.299.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the `CONNECT` request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.299.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.300 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.300.1 Detailed Description

Demo program bootloader interface header file.

7.300.2 Function Documentation

7.300.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.300.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.300.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.301 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.301.1 Detailed Description

Demo program bootloader interface header file.

7.301.2 Function Documentation

7.301.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.301.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.301.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

7.302 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.302.1 Detailed Description

Demo program bootloader interface header file.

7.302.2 Function Documentation

7.302.2.1 [BootActivate\(\)](#)

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.302.2.2 [BootComCheckActivationRequest\(\)](#)

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.302.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.303 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.303.1 Detailed Description

Demo program bootloader interface header file.

7.303.2 Function Documentation

7.303.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.303.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.303.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.304 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.304.1 Detailed Description

Demo program bootloader interface header file.

7.304.2 Function Documentation

7.304.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.304.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.304.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.305 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.305.1 Detailed Description

Demo program bootloader interface header file.

7.305.2 Function Documentation

7.305.2.1 BootActivate()

```
void BootActivate (  
    void )
```

Bootloader activation function.

Returns

none.

7.305.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.305.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.306 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.306.1 Detailed Description

Demo program bootloader interface header file.

7.306.2 Function Documentation

7.306.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

7.306.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

7.306.2.3 BootComInit()

```
void BootComInit (
    void )
```

Initializes the communication interface.

Returns

none.

7.307 boot.h File Reference

Demo program bootloader interface header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [BootComInit](#) (void)
Initializes the communication interface.
- void [BootComCheckActivationRequest](#) (void)
Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.
- void [BootActivate](#) (void)
Bootloader activation function.

7.307.1 Detailed Description

Demo program bootloader interface header file.

7.307.2 Function Documentation

7.307.2.1 BootActivate()

```
void BootActivate (
    void )
```

Bootloader activation function.

Returns

none.

Referenced by [BootComCanCheckActivationRequest\(\)](#), [BootComRs232CheckActivationRequest\(\)](#), and [NetApp\(\)](#).

7.307.2.2 BootComCheckActivationRequest()

```
void BootComCheckActivationRequest (  
    void )
```

Receives the CONNECT request from the host, which indicates that the bootloader should be activated and, if so, activates it.

Returns

none.

Referenced by AppTask(), and main().

7.307.2.3 BootComInit()

```
void BootComInit (  
    void )
```

Initializes the communication interface.

Returns

none.

Referenced by Applnit(), and main().

7.308 boot.h File Reference

Bootloader core module header file.

```
#include "types.h"  
#include "asserts.h"  
#include "blt_conf.h"  
#include "plausibility.h"  
#include "cpu.h"  
#include "cop.h"  
#include "nvm.h"  
#include "timer.h"  
#include "backdoor.h"  
#include "file.h"  
#include "com.h"
```

Include dependency graph for Source/boot.h:

Macros

- `#define BOOT_VERSION_CORE_MAIN (1u)`
Main version number of the bootloader core.
- `#define BOOT_VERSION_CORE_MINOR (12u)`
Minor version number of the bootloader core.
- `#define BOOT_VERSION_CORE_PATCH (1u)`
Patch number of the bootloader core.

Functions

- `void BootInit (void)`
Initializes the bootloader core.
- `void BootTask (void)`
Task function of the bootloader core that drives the program.

7.308.1 Detailed Description

Bootloader core module header file.

7.308.2 Function Documentation

7.308.2.1 BootInit()

```
void BootInit (  
    void )
```

Initializes the bootloader core.

Returns

none

Referenced by `Applnit()`, and `main()`.

7.308.2.2 BootTask()

```
void BootTask (  
    void )
```

Task function of the bootloader core that drives the program.

Returns

none

Referenced by `AppTask()`, and `main()`.

7.309 can.c File Reference

Bootloader CAN communication interface source file.

```
#include "boot.h"
```

Include dependency graph for _template/can.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [CAN_MSG_TX_TIMEOUT_MS](#) (50u)
Timeout for transmitting a CAN message in milliseconds.

Functions

- static [blt_bool](#) [CanGetSpeedConfig](#) ([blt_int16u](#) baud, [blt_int16u](#) *prescaler, [blt_int8u](#) *tseg1, [blt_int8u](#) *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- void [CanInit](#) (void)
Initializes the CAN controller and synchronizes it to the CAN bus.
- void [CanTransmitPacket](#) ([blt_int8u](#) *data, [blt_int8u](#) len)
Transmits a packet formatted for the communication interface.
- [blt_bool](#) [CanReceivePacket](#) ([blt_int8u](#) *data, [blt_int8u](#) *len)
Receives a communication interface packet if one is present.

Variables

- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.

7.309.1 Detailed Description

Bootloader CAN communication interface source file.

7.309.2 Function Documentation

7.309.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int16u * prescaler,
    blt_int8u * tseg1,
    blt_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.309.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

Referenced by ComInit().

7.309.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

Referenced by ComTask().

7.309.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

Referenced by ComTransmitPacket().

7.309.3 Variable Documentation**7.309.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
```

```

{ 8, 3 },
{ 9, 3 },
{ 9, 4 },
{ 10, 4 },
{ 11, 4 },
{ 12, 4 },
{ 12, 5 },
{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.310 can.c File Reference

Bootloader CAN communication interface source file.

```

#include "boot.h"
#include "device_registers.h"

```

Include dependency graph for ARMCM0_S32K11/can.c:

Data Structures

- struct [tCanBusTiming](#)

Structure type for grouping CAN bus timing related information.

Macros

- `#define CAN_INIT_TIMEOUT_MS (250U)`
Timeout for entering/leaving CAN initialization mode in milliseconds.
- `#define CAN_MSG_TX_TIMEOUT_MS (50U)`
Timeout for transmitting a CAN message in milliseconds.
- `#define CANx (CAN0)`
Set the peripheral CAN0 base pointer.
- `#define PCC_FlexCANx_INDEX (PCC_FlexCAN0_INDEX)`
Set the PCC index offset for CAN0.
- `#define CANx_MAX_MB_NUM (FEATURE_CAN0_MAX_MB_NUM)`
Set the number of message boxes supported by CAN0.
- `#define CAN_TX_MSGBOX_NUM (8U)`
The mailbox used for transmitting the XCP respond message.
- `#define CAN_RX_MSGBOX_NUM (9U)`
The mailbox used for receiving the XCP command message.

Functions

- static `blt_bool CanGetSpeedConfig (blt_int16u baud, blt_int16u *prescaler, tCanBusTiming *busTimingCfg)`
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- static void `CanFreezeModeEnter (void)`
Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.
- static void `CanFreezeModeExit (void)`
Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.
- static void `CanDisabledModeEnter (void)`
Places the CAN controller in disabled mode.
- static void `CanDisabledModeExit (void)`
Places the CAN controller in enabled mode.
- void `CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- void `CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- static const `tCanBusTiming canTiming []`
CAN bit timing table for dynamically calculating the bittiming settings.
- static volatile `blt_int32u dummyTimerVal`
Dummy variable to store the CAN controller's free running timer value in. This is needed at the end of a CAN message reception to unlock the mailbox again. If this variable is declared locally within the function, it generates an unwanted compiler warning about assigning a value and not using it. For this reason this dummy variable is declared here as a module global.

7.310.1 Detailed Description

Bootloader CAN communication interface source file.

7.310.2 Function Documentation

7.310.2.1 CanDisabledModeEnter()

```
static void CanDisabledModeEnter (  
    void ) [static]
```

Places the CAN controller in disabled mode.

Returns

none.

Referenced by CanInit().

7.310.2.2 CanDisabledModeExit()

```
static void CanDisabledModeExit (  
    void ) [static]
```

Places the CAN controller in enabled mode.

Returns

none.

Referenced by CanInit().

7.310.2.3 CanFreezeModeEnter()

```
static void CanFreezeModeEnter (  
    void ) [static]
```

Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.

Returns

none.

Referenced by CanInit().

7.310.2.4 CanFreezeModeExit()

```
static void CanFreezeModeExit (
    void ) [static]
```

Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.

Returns

none.

Referenced by CanInit().

7.310.2.5 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int16u * prescaler,
    tCanBusTiming * busTimingCfg ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>busTimingCfg</i>	Pointer to where the bus timing values will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.310.2.6 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.310.2.7 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.310.2.8 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.310.3 Variable Documentation

7.310.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```

=
{
    { 8U, 3U, 2U, 2U },
    { 9U, 3U, 3U, 2U },
    { 10U, 3U, 3U, 3U },
    { 11U, 4U, 3U, 3U },
    { 12U, 4U, 4U, 3U },
    { 13U, 5U, 4U, 3U },
    { 14U, 5U, 4U, 4U },
    { 15U, 6U, 4U, 4U },
    { 16U, 6U, 5U, 4U },
    { 17U, 7U, 5U, 4U },
    { 18U, 7U, 5U, 5U },
    { 19U, 8U, 5U, 5U },
    { 20U, 8U, 6U, 5U },
    { 21U, 8U, 7U, 5U },
    { 22U, 8U, 7U, 6U },
    { 23U, 8U, 8U, 6U },
    { 24U, 8U, 8U, 7U },
    { 25U, 8U, 8U, 8U }
}

```

CAN bit timing table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + TSEG2)

- 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%. A visual representation of the TQ in a bit is: | SYNCSEG | TIME1SEG | TIME2SEG | Or with an alternative representation: | SYNCSEG | PROPSEG | PHASE1SEG | PHASE2SEG | With the alternative representation TIME1SEG = PROPSEG + PHASE1SEG.

Referenced by CanGetSpeedConfig().

7.311 can.c File Reference

Bootloader CAN communication interface source file.

```

#include "boot.h"
#include "stm32f0xx.h"
#include "stm32f0xx_ll_rcc.h"
Include dependency graph for ARMCM0_STM32F0/can.c:

```

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [CAN_MSG_TX_TIMEOUT_MS](#) (50u)
Timeout for transmitting a CAN message in milliseconds.
- #define [CAN_CHANNEL](#) CAN
Set CAN base address to CAN1.

Functions

- static [blt_bool](#) [CanGetSpeedConfig](#) ([blt_int16u](#) baud, [blt_int16u](#) *prescaler, [blt_int8u](#) *tseg1, [blt_int8u](#) *tseg2)

Transmits a packet formatted for the communication interface.
- [blt_bool](#) [CanReceivePacket](#) ([blt_int8u](#) *data, [blt_int8u](#) *len)
Receives a communication interface packet if one is present.

Variables

- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.311.1 Detailed Description

Bootloader CAN communication interface source file.

7.311.2 Function Documentation

7.311.2.1 CanGetSpeedConfig()

```
static blt\_bool CanGetSpeedConfig (
    blt\_int16u baud,
    blt\_int16u * prescaler,
    blt\_int8u * tseg1,
    blt\_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.311.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.311.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.311.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.311.3 Variable Documentation

7.311.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.312 can.c File Reference

Bootloader CAN communication interface source file.

```
#include "boot.h"
#include "xmc_can.h"
#include "xmc_gpio.h"
Include dependency graph for ARMCM0_XMC1/can.c:
```

Macros

- `#define CAN_MSG_TX_TIMEOUT_MS (50u)`
Timeout for transmitting a CAN message in milliseconds.
- `#define CAN_CHANNEL ((CAN_NODE_TypeDef *) (canChannelMap[BOOT_COM_CAN_CHANNEL_INDEX]))`
Macro for accessing the CAN channel handle in the format that is expected by the XMCLib CAN driver.
- `#define CAN_TX_MSBOBJ (CAN_MO0)`
Message object dedicated to message transmission.
- `#define CAN_TX_MSBOBJ_IDX (0)`
Index of the message object dedicated to message transmission.
- `#define CAN_RX_MSBOBJ (CAN_MO1)`
Message object dedicated to message reception.
- `#define CAN_RX_MSBOBJ_IDX (1)`
Index of the message object dedicated to message reception.

Functions

- `void CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- `void CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- static const CAN_NODE_TypeDef * [canChannelMap](#) []
Helper array to quickly convert the channel index, as specific in the boot- loader's configuration header, to the associated channel handle that the XMCLib's CAN driver requires.
- static XMC_CAN_MO_t [transmitMsgObj](#)
Transmit message object data structure.
- static XMC_CAN_MO_t [receiveMsgObj](#)
Receive message object data structure.

7.312.1 Detailed Description

Bootloader CAN communication interface source file.

7.312.2 Function Documentation

7.312.2.1 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.312.2.2 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.312.2.3 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.313 can.c File Reference

Bootloader CAN communication interface source file.

```
#include "boot.h"
#include "stm32l5xx.h"
#include "stm32l5xx_ll_rcc.h"
Include dependency graph for ARMCM33_STM32L5/can.c:
```

Data Structures

- struct [tCanBusTiming](#)

Structure type for grouping CAN bus timing related information.

Macros

- `#define CAN_MSG_TX_TIMEOUT_MS` (50u)
Timeout for transmitting a CAN message in milliseconds.
- `#define CAN_CHANNEL` FDCAN1
Set CAN base address to CAN1.

Functions

- static `blt_bool CanGetSpeedConfig` (`blt_int16u` baud, `blt_int16u` *prescaler, `blt_int8u` *tseg1, `blt_int8u` *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- void `CanInit` (void)
Initializes the CAN controller and synchronizes it to the CAN bus.
- void `CanTransmitPacket` (`blt_int8u` *data, `blt_int8u` len)
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket` (`blt_int8u` *data, `blt_int8u` *len)
Receives a communication interface packet if one is present.

Variables

- static const `tCanBusTiming` canTiming []
CAN bittiming table for dynamically calculating the bittiming settings.
- static FDCAN_HandleTypeDef `canHandle`
CAN handle to be used in API calls.

7.313.1 Detailed Description

Bootloader CAN communication interface source file.

7.313.2 Function Documentation

7.313.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int16u * prescaler,
    blt_int8u * tseg1,
    blt_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.313.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.313.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE if a packet was received, BLT_FALSE otherwise.

7.313.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.313.3 Variable Documentation**7.313.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=  
{  
  
    { 5, 2 },  
    { 6, 2 },  
    { 6, 3 },  
    { 7, 3 },  
    { 8, 3 },  
    { 9, 3 },  
    { 9, 4 },  
    { 10, 4 },  
    { 11, 4 },  
    { 12, 4 },  
    { 12, 5 },  
    { 13, 5 },  
    { 14, 5 },  
    { 15, 5 },  
    { 15, 6 },  
    { 16, 6 },  
    { 16, 7 },  
    { 16, 8 }  
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.314 can.c File Reference

Bootloader CAN communication interface source file.

```
#include "boot.h"
#include "inc/hw_memmap.h"
#include "inc/hw_types.h"
#include "driverlib/sysctl.h"
#include "driverlib/canlib.h"
Include dependency graph for ARMCM3_LM3S/can.c:
```

Macros

- `#define CAN_MSG_TX_TIMEOUT_MS (50u)`
Timeout for transmitting a CAN message in milliseconds.
- `#define CAN_RX_MSGOBJECT_IDX (0)`
Index of the used reception message object.
- `#define CAN_TX_MSGOBJECT_IDX (1)`
Index of the used transmission message object.

Functions

- static `blt_int8u CanSetBittiming (void)`
*Attempts to match the bittiming parameters to the requested baudrate for a sample point between 65 and 75%, through a linear search algorithm. It is based on the equation: $\text{baudrate} = \text{CAN Clock Freq} / ((1 + \text{PropSeg} + \text{Phase1} \leftrightarrow \text{Seg} + \text{Phase2Seg}) * \text{Prescaler})$*
- void `CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- void `CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- static const `blt_int16u canBitNum2Mask []`
Lookup table to quickly and efficiently convert a bit number to a bit mask.

7.314.1 Detailed Description

Bootloader CAN communication interface source file.

7.314.2 Function Documentation

7.314.2.1 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.314.2.2 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.314.2.3 CanSetBittiming()

```
static blt_int8u CanSetBittiming (
    void ) [static]
```

Attempts to match the bittiming parameters to the requested baudrate for a sample point between 65 and 75%, through a linear search algorithm. It is based on the equation: baudrate = CAN Clock Freq/((1+PropSeg+Phase1↔Seg+Phase2Seg)*Prescaler)

Returns

BLT_TRUE if a valid bittiming configuration was found and set. BLT_FALSE otherwise.

Referenced by CanInit().

7.314.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.315 can.c File Reference

Bootloader CAN communication interface source file.

```
#include "boot.h"
#include "stm32f1xx.h"
#include "stm32f1xx_ll_rcc.h"
Include dependency graph for ARMCM3_STM32F1/can.c:
```

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [CAN_MSG_TX_TIMEOUT_MS](#) (50u)
Timeout for transmitting a CAN message in milliseconds.
- #define [CAN_CHANNEL](#) CAN1
Set CAN base address to CAN1.

Functions

- static `blt_bool CanGetSpeedConfig (blt_int16u baud, blt_int16u *prescaler, blt_int8u *tseg1, blt_int8u *tseg2)`
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- void `CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- void `CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- static const `tCanBusTiming canTiming []`
CAN bittiming table for dynamically calculating the bittiming settings.
- static `CAN_HandleTypeDef canHandle`
CAN handle to be used in API calls.

7.315.1 Detailed Description

Bootloader CAN communication interface source file.

7.315.2 Function Documentation

7.315.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int16u * prescaler,
    blt_int8u * tseg1,
    blt_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.315.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.315.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.315.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.315.3 Variable Documentation**7.315.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{

7.317 can.c File Reference

Bootloader CAN communication interface source file.

```

#include "boot.h"
#include "device_registers.h"
Include dependency graph for ARMCM4_S32K14/can.c:

```

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [CAN_INIT_TIMEOUT_MS](#) (250U)
Timeout for entering/leaving CAN initialization mode in milliseconds.
- #define [CAN_MSG_TX_TIMEOUT_MS](#) (50U)
Timeout for transmitting a CAN message in milliseconds.
- #define [CANx](#) (CAN0)
Set the peripheral CAN0 base pointer.

- `#define PCC_FlexCANx_INDEX` (`PCC_FlexCAN0_INDEX`)
Set the PCC index offset for CAN0.
- `#define CANx_MAX_MB_NUM` (`FEATURE_CAN0_MAX_MB_NUM`)
Set the number of message boxes supported by CAN0.
- `#define CAN_TX_MSGBOX_NUM` (8U)
The mailbox used for transmitting the XCP respond message.
- `#define CAN_RX_MSGBOX_NUM` (9U)
The mailbox used for receiving the XCP command message.

Functions

- static `blt_bool CanGetSpeedConfig` (`blt_int16u` baud, `blt_int16u` *prescaler, `tCanBusTiming` *busTimingCfg)
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- static void `CanFreezeModeEnter` (void)
Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.
- static void `CanFreezeModeExit` (void)
Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.
- static void `CanDisabledModeEnter` (void)
Places the CAN controller in disabled mode.
- static void `CanDisabledModeExit` (void)
Places the CAN controller in enabled mode.
- void `CanInit` (void)
Initializes the CAN controller and synchronizes it to the CAN bus.
- void `CanTransmitPacket` (`blt_int8u` *data, `blt_int8u` len)
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket` (`blt_int8u` *data, `blt_int8u` *len)
Receives a communication interface packet if one is present.

Variables

- static const `tCanBusTiming` canTiming []
CAN bit timing table for dynamically calculating the bittiming settings.
- static volatile `blt_int32u` dummyTimerVal
Dummy variable to store the CAN controller's free running timer value in. This is needed at the end of a CAN message reception to unlock the mailbox again. If this variable is declared locally within the function, it generates an unwanted compiler warning about assigning a value and not using it. For this reason this dummy variable is declare here as a module global.

7.317.1 Detailed Description

Bootloader CAN communication interface source file.

7.317.2 Function Documentation

7.317.2.1 CanDisabledModeEnter()

```
static void CanDisabledModeEnter (  
    void ) [static]
```

Places the CAN controller in disabled mode.

Returns

none.

Referenced by CanInit().

7.317.2.2 CanDisabledModeExit()

```
static void CanDisabledModeExit (  
    void ) [static]
```

Places the CAN controller in enabled mode.

Returns

none.

Referenced by CanInit().

7.317.2.3 CanFreezeModeEnter()

```
static void CanFreezeModeEnter (  
    void ) [static]
```

Places the CAN controller in freeze mode. Note that the CAN controller can only be placed in freeze mode, if it is actually enabled.

Returns

none.

Referenced by CanInit().

7.317.2.4 CanFreezeModeExit()

```
static void CanFreezeModeExit (  
    void ) [static]
```

Leaves the CAN controller's freeze mode. Note that this operation can only be done, if it is actually enabled.

Returns

none.

Referenced by CanInit().

7.317.2.5 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (  
    blt_int16u baud,  
    blt_int16u * prescaler,  
    tCanBusTiming * busTimingCfg ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>busTimingCfg</i>	Pointer to where the bus timing values will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.317.2.6 CanInit()

```
void CanInit (  
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.317.2.7 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.317.2.8 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.317.3 Variable Documentation

7.317.3.1 canTiming

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```

=
{

    { 8U, 3U, 2U, 2U },
    { 9U, 3U, 3U, 2U },
    { 10U, 3U, 3U, 3U },
    { 11U, 4U, 3U, 3U },
    { 12U, 4U, 4U, 3U },
    { 13U, 5U, 4U, 3U },
    { 14U, 5U, 4U, 4U },
    { 15U, 6U, 4U, 4U },
    { 16U, 6U, 5U, 4U },
    { 17U, 7U, 5U, 4U },
    { 18U, 7U, 5U, 5U },
    { 19U, 8U, 5U, 5U },
    { 20U, 8U, 6U, 5U },
    { 21U, 8U, 7U, 5U },
    { 22U, 8U, 7U, 6U },
    { 23U, 8U, 8U, 6U },
    { 24U, 8U, 8U, 7U },
    { 25U, 8U, 8U, 8U }
}

```

CAN bit timing table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + TSEG2)

- 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%. A visual representation of the TQ in a bit is: | SYNCSEG | TIME1SEG | TIME2SEG | Or with an alternative representation: | SYNCSEG | PROPSEG | PHASE1SEG | PHASE2SEG | With the alternative representation TIME1SEG = PROPSEG + PHASE1SEG.

Referenced by CanGetSpeedConfig().

7.318.1 Detailed Description

Bootloader CAN communication interface source file.

7.318.2 Function Documentation

7.318.2.1 CanGetSpeedConfig()

```
static blt\_bool CanGetSpeedConfig (
    blt\_int16u baud,
    blt\_int16u * prescaler,
    blt\_int8u * tseg1,
    blt\_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.318.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.318.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.318.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

Set CAN base address to CAN1.

Functions

- static [blt_bool](#) [CanGetSpeedConfig](#) ([blt_int16u](#) baud, [blt_int16u](#) *prescaler, [blt_int8u](#) *tseg1, [blt_int8u](#) *tseg2)
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- void [CanInit](#) (void)
Initializes the CAN controller and synchronizes it to the CAN bus.
- void [CanTransmitPacket](#) ([blt_int8u](#) *data, [blt_int8u](#) len)
Transmits a packet formatted for the communication interface.
- [blt_bool](#) [CanReceivePacket](#) ([blt_int8u](#) *data, [blt_int8u](#) *len)
Receives a communication interface packet if one is present.

Variables

- static const [tCanBusTiming](#) [canTiming](#) []
CAN bittiming table for dynamically calculating the bittiming settings.
- static CAN_HandleTypeDef [canHandle](#)
CAN handle to be used in API calls.

7.319.1 Detailed Description

Bootloader CAN communication interface source file.

7.319.2 Function Documentation

7.319.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (  
    blt_int16u baud,  
    blt_int16u * prescaler,  
    blt_int8u * tseg1,  
    blt_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.319.2.2 CanInit()

```
void CanInit (  
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.319.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (  
    blt_int8u * data,  
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.319.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.319.3 Variable Documentation**7.319.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
```

```

{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

7.320 can.c File Reference

Bootloader CAN communication interface source file.

```

#include "boot.h"
#include "stm32l4xx.h"
#include "stm32l4xx_ll_rcc.h"

```

Include dependency graph for ARMCM4_STM32L4/can.c:

Data Structures

- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- #define [CAN_MSG_TX_TIMEOUT_MS](#) (50u)
Timeout for transmitting a CAN message in milliseconds.

Functions

- static `blt_bool CanGetSpeedConfig (blt_int16u baud, blt_int16u *prescaler, blt_int8u *tseg1, blt_int8u *tseg2)`
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- void `CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- void `CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- static const `tCanBusTiming canTiming []`
CAN bittiming table for dynamically calculating the bittiming settings.
- static `CAN_HandleTypeDef canHandle`
CAN handle to be used in API calls.

7.320.1 Detailed Description

Bootloader CAN communication interface source file.

7.320.2 Function Documentation

7.320.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int16u * prescaler,
    blt_int8u * tseg1,
    blt_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.320.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.320.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.320.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.320.3 Variable Documentation**7.320.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
    { 13, 5 },
    { 14, 5 },
    { 15, 5 },
    { 15, 6 },
    { 16, 6 },
    { 16, 7 },
    { 16, 8 }
}
```

CAN bittiming table for dynamically calculating the bittiming settings.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2) * 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

7.321 can.c File Reference

Bootloader CAN communication interface source file.

```
#include "boot.h"
#include "xmc_can.h"
```

```
#include "xmc_gpio.h"
```

Include dependency graph for ARMCM4_XMC4/can.c:

Macros

- `#define CAN_MSG_TX_TIMEOUT_MS (50u)`
Timeout for transmitting a CAN message in milliseconds.
- `#define CAN_CHANNEL ((CAN_NODE_TypeDef *)(canChannelMap[BOOT_COM_CAN_CHANNEL_INDEX]))`
Macro for accessing the CAN channel handle in the format that is expected by the XMCLib CAN driver.
- `#define CAN_TX_MSBOBJ (CAN_MO0)`
Message object dedicated to message transmission.
- `#define CAN_TX_MSBOBJ_IDX (0)`
Index of the message object dedicated to message transmission.
- `#define CAN_RX_MSBOBJ (CAN_MO1)`
Message object dedicated to message reception.
- `#define CAN_RX_MSBOBJ_IDX (1)`
Index of the message object dedicated to message reception.

Functions

- `void CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- `void CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- `static const CAN_NODE_TypeDef * canChannelMap []`
Helper array to quickly convert the channel index, as specific in the boot- loader's configuration header, to the associated channel handle that the XMCLib's CAN driver requires.
- `static XMC_CAN_MO_t transmitMsgObj`
Transmit message object data structure.
- `static XMC_CAN_MO_t receiveMsgObj`
Receive message object data structure.

7.321.1 Detailed Description

Bootloader CAN communication interface source file.

7.321.2 Function Documentation

7.321.2.1 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.321.2.2 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.321.2.3 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.322 can.c File Reference

- static const `tCanBusTiming canTiming []`
CAN bittiming table for dynamically calculating the bittiming settings.
- static `CAN_HandleTypeDef canHandle`
CAN handle to be used in API calls.

7.322.1 Detailed Description

Bootloader CAN communication interface source file.

7.322.2 Function Documentation

7.322.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int16u * prescaler,
    blt_int8u * tseg1,
    blt_int8u * tseg2 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>prescaler</i>	Pointer to where the value for the prescaler will be stored.
<i>tseg1</i>	Pointer to where the value for TSEG2 will be stored.
<i>tseg2</i>	Pointer to where the value for TSEG2 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.322.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.322.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.322.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.322.3 Variable Documentation**7.322.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },

Bootloader CAN communication interface source file.

```
#include "boot.h"
```

Include dependency graph for HCS12/can.c:

Data Structures

- struct [tCanRxMsgSlot](#)
Structure type with the layout of a CAN reception message slot.
- struct [tCanTxMsgSlot](#)
Structure type with the layout of a CAN transmit message slot.
- struct [tCanRegs](#)
Structure type with the layout of the CAN related control registers.
- struct [tCanBusTiming](#)
Structure type for grouping CAN bus timing related information.

Macros

- `#define CAN_INIT_TIMEOUT_MS (250u)`
Timeout for entering/leaving CAN initialization mode in milliseconds.
- `#define CAN_MSG_TX_TIMEOUT_MS (50u)`
Timeout for transmitting a CAN message in milliseconds.
- `#define CAN_REGS_BASE_ADDRESS (0x0140)`
Set CAN base address to CAN0.
- `#define CAN ((volatile tCanRegs *)CAN_REGS_BASE_ADDRESS)`
Macro for accessing the CAN related control registers.
- `#define EXTIDMASK_BIT (0x80000000)`
Configures a CAN message id for 29-bit (extended).
- `#define INITRQ_BIT (0x01)`
Initialization mode request bit.
- `#define INITAK_BIT (0x01)`
Initialization mode handshake bit.
- `#define CANE_BIT (0x80)`
CAN controller enable bit.
- `#define IDAM0_BIT (0x10)`
Filter mode bit 0.
- `#define IDAM1_BIT (0x20)`
Filter mode bit 1.
- `#define TX0_BIT (0x01)`
Transmit buffer 0 select bit.
- `#define TXE0_BIT (0x01)`
Transmit buffer 0 empty bit.
- `#define IDE_BIT (0x08)`
29-bit extended id bit.
- `#define RXF_BIT (0x01)`
Receive buffer full flag bit.

Functions

- `static blt_bool CanGetSpeedConfig (blt_int16u baud, blt_int8u *btr0, blt_int8u *btr1)`
Search algorithm to match the desired baudrate to a possible bus timing configuration.
- `void CanInit (void)`
Initializes the CAN controller and synchronizes it to the CAN bus.
- `void CanTransmitPacket (blt_int8u *data, blt_int8u len)`
Transmits a packet formatted for the communication interface.
- `blt_bool CanReceivePacket (blt_int8u *data, blt_int8u *len)`
Receives a communication interface packet if one is present.

Variables

- `static const tCanBusTiming canTiming []`
Array with possible time quanta configurations.

7.324.1 Detailed Description

Bootloader CAN communication interface source file.

7.324.2 Function Documentation

7.324.2.1 CanGetSpeedConfig()

```
static blt_bool CanGetSpeedConfig (
    blt_int16u baud,
    blt_int8u * btr0,
    blt_int8u * btr1 ) [static]
```

Search algorithm to match the desired baudrate to a possible bus timing configuration.

Parameters

<i>baud</i>	The desired baudrate in kbps. Valid values are 10..1000.
<i>btr0</i>	Pointer to where the value for register CANxBTR0 will be stored.
<i>btr1</i>	Pointer to where the value for register CANxBTR1 will be stored.

Returns

BLT_TRUE if the CAN bustiming register values were found, BLT_FALSE otherwise.

Referenced by CanInit().

7.324.2.2 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

7.324.2.3 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

7.324.2.4 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

7.324.3 Variable Documentation**7.324.3.1 canTiming**

```
const tCanBusTiming canTiming[] [static]
```

Initial value:

```
=
{
    { 5, 2 },
    { 6, 2 },
    { 6, 3 },
    { 7, 3 },
    { 8, 3 },
    { 9, 3 },
    { 9, 4 },
    { 10, 4 },
    { 11, 4 },
    { 12, 4 },
    { 12, 5 },
```

```

{ 13, 5 },
{ 14, 5 },
{ 15, 5 },
{ 15, 6 },
{ 16, 6 },
{ 16, 7 },
{ 16, 8 }
}

```

Array with possible time quanta configurations.

According to the CAN protocol 1 bit-time can be made up of between 8..25 time quanta (TQ). The total TQ in a bit is SYNC + TSEG1 + TSEG2 with SYNC always being 1. The sample point is (SYNC + TSEG1) / (SYNC + TSEG1 + SEG2)

- 100%. This array contains possible and valid time quanta configurations with a sample point between 68..78%.

Referenced by CanGetSpeedConfig().

This graph shows which files directly or indirectly include this file:

Functions

- void [CanInit](#) (void)
Initializes the CAN controller and synchronizes it to the CAN bus.
- void [CanTransmitPacket](#) (blt_int8u *data, blt_int8u len)
Transmits a packet formatted for the communication interface.
- blt_bool [CanReceivePacket](#) (blt_int8u *data, blt_int8u *len)
Receives a communication interface packet if one is present.

7.325.1 Detailed Description

Bootloader CAN communication interface header file.

7.325.2 Function Documentation

7.325.2.1 CanInit()

```
void CanInit (
    void )
```

Initializes the CAN controller and synchronizes it to the CAN bus.

Returns

none.

Referenced by ComInit().

7.325.2.2 CanReceivePacket()

```
blt_bool CanReceivePacket (
    blt_int8u * data,
    blt_int8u * len )
```

Receives a communication interface packet if one is present.

Parameters

<i>data</i>	Pointer to byte array where the data is to be stored.
<i>len</i>	Pointer where the length of the packet is to be stored.

Returns

BLT_TRUE is a packet was received, BLT_FALSE otherwise.

Referenced by ComTask().

7.325.2.3 CanTransmitPacket()

```
void CanTransmitPacket (
    blt_int8u * data,
    blt_int8u len )
```

Transmits a packet formatted for the communication interface.

Parameters

<i>data</i>	Pointer to byte array with data that it to be transmitted.
<i>len</i>	Number of bytes that are to be transmitted.

Returns

none.

Referenced by ComTransmitPacket().

7.326 com.c File Reference

Bootloader communication interface source file.

```
#include "boot.h"
#include "can.h"
#include "usb.h"
#include "net.h"
```

Include dependency graph for com.c:

Functions

- void [ComInit](#) (void)
Initializes the communication module including the hardware needed for the communication.
- void [ComTask](#) (void)
Updates the communication module by checking if new data was received and submitting the request to process newly received data.
- void [ComFree](#) (void)
Releases the communication module.
- void [ComTransmitPacket](#) (blt_int8u *data, blt_int16u len)
Transmits the packet using the xcp transport layer.
- blt_int16u [ComGetActiveInterfaceMaxRxLen](#) (void)
Obtains the maximum number of bytes that can be received on the specified communication interface.
- blt_int16u [ComGetActiveInterfaceMaxTxLen](#) (void)
Obtains the maximum number of bytes that can be transmitted on the specified communication interface.
- blt_bool [ComIsConnected](#) (void)
This function obtains the XCP connection state.

Variables

- static `tComInterfaceId comActiveInterface = COM_IF_OTHER`
Holds the communication interface of the currently active interface.

7.326.1 Detailed Description

Bootloader communication interface source file.

7.326.2 Function Documentation

7.326.2.1 ComFree()

```
void ComFree (
    void )
```

Releases the communication module.

Returns

none

Referenced by `CpuStartUserProgram()`.

7.326.2.2 ComGetActiveInterfaceMaxRxLen()

```
blt_int16u ComGetActiveInterfaceMaxRxLen (
    void )
```

Obtains the maximum number of bytes that can be received on the specified communication interface.

Returns

Maximum number of bytes that can be received.

7.326.2.3 ComGetActiveInterfaceMaxTxLen()

```
blt_int16u ComGetActiveInterfaceMaxTxLen (
    void )
```

Obtains the maximum number of bytes that can be transmitted on the specified communication interface.

Returns

Maximum number of bytes that can be received.

7.326.2.4 ComInit()

```
void ComInit (
    void )
```

Initializes the communication module including the hardware needed for the communication.

Returns

none

Referenced by BootInit().

7.326.2.5 ComIsConnected()

```
blt_bool ComIsConnected (
    void )
```

This function obtains the XCP connection state.

Returns

BLT_TRUE when an XCP connection is established, BLT_FALSE otherwise.

Referenced by BackDoorCheck(), and FileHandleFirmwareUpdateRequest().

7.326.2.6 ComTask()

```
void ComTask (
    void )
```

Updates the communication module by checking if new data was received and submitting the request to process newly received data.

Returns

none

Referenced by BootTask().

7.326.2.7 ComTransmitPacket()

```
void ComTransmitPacket (
    blt_int8u * data,
    blt_int16u len )
```

Transmits the packet using the xcp transport layer.

Parameters

<i>data</i>	Pointer to the byte buffer with packet data.
<i>len</i>	Number of data bytes that need to be transmitted.

Returns

none

Referenced by XcpTransmitPacket().

7.327 com.h File Reference

Bootloader communication interface header file.

```
#include "xcp.h"
```

Include dependency graph for com.h:

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOT_COM_RX_MAX_DATA (1)`
Defines the maximum number of bytes for transport layer reception depending on the activates interface(s).
- `#define BOOT_COM_RX_MAX_DATA (BOOT_COM_CAN_RX_MAX_DATA)`
Defines the maximum number of bytes for transport layer reception depending on the activates interface(s).
- `#define BOOT_COM_RX_MAX_DATA (BOOT_COM_NET_RX_MAX_DATA)`
Defines the maximum number of bytes for transport layer reception depending on the activates interface(s).
- `#define BOOT_COM_TX_MAX_DATA (1)`
Defines the maximum number of bytes for transport layer transmission depending on the activates interface(s).
- `#define BOOT_COM_TX_MAX_DATA (BOOT_COM_CAN_TX_MAX_DATA)`
Defines the maximum number of bytes for transport layer transmission depending on the activates interface(s).
- `#define BOOT_COM_TX_MAX_DATA (BOOT_COM_USB_TX_MAX_DATA)`
Defines the maximum number of bytes for transport layer transmission depending on the activates interface(s).
- `#define BOOT_COM_TX_MAX_DATA (BOOT_COM_NET_TX_MAX_DATA)`
Defines the maximum number of bytes for transport layer transmission depending on the activates interface(s).

Enumerations

- enum `tComInterfaceId` {
`COM_IF_RS232`, `COM_IF_CAN`, `COM_IF_USB`, `COM_IF_NET`,
`COM_IF_OTHER` }

Enumeration for the different communication interfaces.

Functions

- void `ComInit` (void)
Initializes the communication module including the hardware needed for the communication.
- void `ComTask` (void)
Updates the communication module by checking if new data was received and submitting the request to process newly received data.
- void `ComFree` (void)
Releases the communication module.
- `blt_int16u ComGetActiveInterfaceMaxRxLen` (void)
Obtains the maximum number of bytes that can be received on the specified communication interface.
- `blt_int16u ComGetActiveInterfaceMaxTxLen` (void)
Obtains the maximum number of bytes that can be transmitted on the specified communication interface.
- void `ComTransmitPacket` (`blt_int8u *data`, `blt_int16u len`)
Transmits the packet using the xcp transport layer.
- `blt_bool ComIsConnected` (void)
This function obtains the XCP connection state.

7.327.1 Detailed Description

Bootloader communication interface header file.

7.327.2 Enumeration Type Documentation

7.327.2.1 tComInterfaceId

enum `tComInterfaceId`

Enumeration for the different communication interfaces.

Enumerator

<code>COM_IF_RS232</code>	RS232 interface
<code>COM_IF_CAN</code>	CAN interface
<code>COM_IF_USB</code>	USB interface
<code>COM_IF_NET</code>	NET interface
<code>COM_IF_OTHER</code>	Other interface

7.327.3 Function Documentation

7.327.3.1 ComFree()

```
void ComFree (
    void )
```

Releases the communication module.

Returns

none

Referenced by CpuStartUserProgram().

7.327.3.2 ComGetActiveInterfaceMaxRxLen()

```
blt_int16u ComGetActiveInterfaceMaxRxLen (
    void )
```

Obtains the maximum number of bytes that can be received on the specified communication interface.

Returns

Maximum number of bytes that can be received.

7.327.3.3 ComGetActiveInterfaceMaxTxLen()

```
blt_int16u ComGetActiveInterfaceMaxTxLen (
    void )
```

Obtains the maximum number of bytes that can be transmitted on the specified communication interface.

Returns

Maximum number of bytes that can be received.

7.327.3.4 ComInit()

```
void ComInit (
    void )
```

Initializes the communication module including the hardware needed for the communication.

Returns

none

Referenced by BootInit().

7.327.3.5 ComIsConnected()

```
blt_bool ComIsConnected (
    void )
```

This function obtains the XCP connection state.

Returns

BLT_TRUE when an XCP connection is established, BLT_FALSE otherwise.

Referenced by BackDoorCheck(), and FileHandleFirmwareUpdateRequest().

7.327.3.6 ComTask()

```
void ComTask (
    void )
```

Updates the communication module by checking if new data was received and submitting the request to process newly received data.

Returns

none

Referenced by BootTask().

7.327.3.7 ComTransmitPacket()

```
void ComTransmitPacket (
    blt_int8u * data,
    blt_int16u len )
```

Transmits the packet using the xcp transport layer.

Parameters

<i>data</i>	Pointer to the byte buffer with packet data.
<i>len</i>	Number of data bytes that need to be transmitted.

Returns

none

Referenced by XcpTransmitPacket().

7.328 cop.c File Reference

Bootloader watchdog module source file.

```
#include "boot.h"
```

Include dependency graph for cop.c:

Functions

- void [CopInitHook](#) (void)
Callback that gets called at the end of the internal COP driver initialization routine. It can be used to configure and enable the watchdog.
- void [CopServiceHook](#) (void)
Callback that gets called at the end of the internal COP driver service routine. This gets called upon initialization and during potential long lasting loops and routine. It can be used to service the watchdog to prevent a watchdog reset.
- void [CopInit](#) (void)
Watchdog initialization function.
- void [CopService](#) (void)
Watchdog service function to prevent the watchdog from timing out.

7.328.1 Detailed Description

Bootloader watchdog module source file.

7.328.2 Function Documentation

7.328.2.1 CopInit()

```
void CopInit (
    void )
```

Watchdog initialization function.

Returns

none

Referenced by BootInit().

7.328.2.2 CopInitHook()

```
void CopInitHook (
    void )
```

Callback that gets called at the end of the internal COP driver initialization routine. It can be used to configure and enable the watchdog.

Returns

none.

Referenced by CopInit().

7.328.2.3 CopService()

```
void CopService (
    void )
```

Watchdog service function to prevent the watchdog from timing out.

Returns

none

Referenced by AssertFailure(), BootTask(), CanDisabledModeEnter(), CanDisabledModeExit(), CanFreeze↔ModeEnter(), CanFreezeModeExit(), CanGetSpeedConfig(), CanInit(), CanTransmitPacket(), CpuMemCopy(), CpuMemSet(), FileFirmwareUpdateLogHook(), FlashAddToBlock(), FlashErase(), FlashEraseSectors(), Flash↔GetSector(), FlashGetSectorBaseAddr(), FlashGetSectorIdx(), FlashGetSectorSize(), FlashWriteBlock(), Usb↔TransmitPacket(), and XcpComputeChecksum().

7.328.2.4 CopServiceHook()

```
void CopServiceHook (
    void )
```

Callback that gets called at the end of the internal COP driver service routine. This gets called upon initialization and during potential long lasting loops and routine. It can be used to service the watchdog to prevent a watchdog reset.

Returns

none.

Referenced by CopService().

7.329 cop.h File Reference

Bootloader watchdog module header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [CopInit](#) (void)
Watchdog initialization function.
- void [CopService](#) (void)
Watchdog service function to prevent the watchdog from timing out.

7.329.1 Detailed Description

Bootloader watchdog module header file.

7.329.2 Function Documentation

7.329.2.1 CopInit()

```
void CopInit (
    void )
```

Watchdog initialization function.

Returns

none

Referenced by BootInit().

7.329.2.2 CopService()

```
void CopService (
    void )
```

Watchdog service function to prevent the watchdog from timing out.

Returns

none

Referenced by AssertFailure(), BootTask(), CanDisabledModeEnter(), CanDisabledModeExit(), CanFreezeModeEnter(), CanFreezeModeExit(), CanGetSpeedConfig(), CanInit(), CanTransmitPacket(), CpuMemCopy(), CpuMemSet(), FileFirmwareUpdateLogHook(), FlashAddToBlock(), FlashErase(), FlashEraseSectors(), FlashGetSector(), FlashGetSectorBaseAddr(), FlashGetSectorIdx(), FlashGetSectorSize(), FlashWriteBlock(), UsbTransmitPacket(), and XcpComputeChecksum().

7.330 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for _template/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_addr)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.330.1 Detailed Description

Bootloader cpu module source file.

7.330.2 Function Documentation

7.330.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

Referenced by BootInit().

7.330.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

Referenced by FlashInitBlock(), UsbReceivePacket(), XcpCmdGetSeed(), XcpCmdShortUpload(), XcpCmdUnlock(), and XcpCmdUpload().

7.330.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

Referenced by XcpCmdShortUpload(), and XcpCmdUpload().

7.330.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

Referenced by BackDoorCheck(), BackDoorInit(), FileTask(), and XcpCmdProgramReset().

7.330.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.331 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
#include "device_registers.h"
Include dependency graph for ARMCM0_S32K11/cpu.c:
```

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_addr)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.331.1 Detailed Description

Bootloader cpu module source file.

7.331.2 Function Documentation

7.331.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.331.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.331.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.331.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.331.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.332 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
#include "stm32f0xx.h"
#include "stm32f0xx_ll_bus.h"
#include "stm32f0xx_ll_system.h"
Include dependency graph for ARMCM0_STM32F0/cpu.c:
```

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.
- `#define CPU_USER_PROGRAM_VECTABLE_SIZE (0xC0u)`
Size in bytes of the user program's vector table.
- `#define CPU_USER_PROGRAM_RAM_BASEADDR ((blt_addr)(0x20000000))`
Start address of the user program's RAM where its vector table will be copied to.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.332.1 Detailed Description

Bootloader cpu module source file.

7.332.2 Function Documentation

7.332.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.332.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

Referenced by CpuStartUserProgram().

7.332.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.332.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.332.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.333 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
#include "stm32g0xx.h"
#include "stm32g0xx_ll_bus.h"
#include "stm32g0xx_ll_system.h"
Include dependency graph for ARMCM0_STM32G0/cpu.c:
```

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.333.1 Detailed Description

Bootloader cpu module source file.

7.333.2 Function Documentation

7.333.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.333.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.333.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.333.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.333.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.334 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM0_XMC1/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.334.1 Detailed Description

Bootloader cpu module source file.

7.334.2 Function Documentation

7.334.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.334.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.334.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.334.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.334.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.335 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

```
#include "stm32l5xx.h"
```

Include dependency graph for ARMCM33_STM32L5/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.335.1 Detailed Description

Bootloader cpu module source file.

7.335.2 Function Documentation

7.335.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.335.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.335.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.335.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.335.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.336 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM3_EFM32/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.
- `#define SCB_VTOR (*(volatile blt_int32u *) 0xE00ED08)`
Vector table offset register.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.337.1 Detailed Description

Bootloader cpu module source file.

7.337.2 Function Documentation

7.337.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.337.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.337.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.337.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.337.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

Sets the bytes at the destination address to the specified value.

7.338.1 Detailed Description

Bootloader cpu module source file.

7.338.2 Function Documentation

7.338.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.338.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.338.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.338.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.338.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Sets the bytes at the destination address to the specified value.

7.339.1 Detailed Description

Bootloader cpu module source file.

7.339.2 Function Documentation

7.339.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.339.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.339.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.339.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.339.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

Sets the bytes at the destination address to the specified value.

7.340.1 Detailed Description

Bootloader cpu module source file.

7.340.2 Function Documentation

7.340.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.340.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.340.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.340.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.340.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

Sets the bytes at the destination address to the specified value.

7.341.1 Detailed Description

Bootloader cpu module source file.

7.341.2 Function Documentation

7.341.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.341.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.341.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.341.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.341.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.342.1 Detailed Description

Bootloader cpu module source file.

7.342.2 Function Documentation

7.342.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.342.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.342.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.342.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.342.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.343.1 Detailed Description

Bootloader cpu module source file.

7.343.2 Function Documentation

7.343.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.343.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.343.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.343.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.343.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.344 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_TM4C/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.
- `#define SCB_VTOR (*(volatile blt_int32u *) 0xE00ED08)`
Vector table offset register.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.344.1 Detailed Description

Bootloader cpu module source file.

7.344.2 Function Documentation

7.344.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.344.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.344.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.344.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.344.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.345 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_XMC4/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.
- `#define SCB_VTOR (*(volatile blt_int32u *) 0xE00ED08)`
Vector table offset register.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`

- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.345.1 Detailed Description

Bootloader cpu module source file.

7.345.2 Function Documentation

7.345.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.345.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.345.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.345.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.345.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.346 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

```
#include "stm32f7xx.h"
```

Include dependency graph for ARMCM7_STM32F7/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR ((blt_addr)(NvmGetUserProgBaseAddress() + 0x00000004))`
Pointer to the user program's reset vector.
- `#define CPU_USER_PROGRAM_VECTABLE_OFFSET ((blt_int32u)NvmGetUserProgBaseAddress())`
Pointer to the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.346.1 Detailed Description

Bootloader cpu module source file.

7.346.2 Function Documentation

7.346.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.346.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.346.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.346.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (  
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.346.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (  
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.347.1 Detailed Description

Bootloader cpu module source file.

7.347.2 Function Documentation

7.347.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

7.347.2.2 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.347.2.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.347.2.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.347.2.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.348 cpu.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for HCS12/cpu.c:

Macros

- `#define CPU_USER_PROGRAM_STARTADDR_PTR (NvmGetUserProgBaseAddress() - 2)`
Start address of the user program. This is the address of the reset vector in the user program's vector table.

Functions

- `blt_bool CpuUserProgramStartHook (void)`
Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.
- `void CpuInit (void)`
Initializes the CPU module.
- `void CpuStartUserProgram (void)`
Starts the user program, if one is present. In this case this function does not return.
- `void CpuMemCopy (blt_addr dest, blt_addr src, blt_int16u len)`
Copies data from the source to the destination address.
- `void CpuMemSet (blt_addr dest, blt_int8u value, blt_int16u len)`
Sets the bytes at the destination address to the specified value.

7.348.1 Detailed Description

Bootloader cpu module source file.

7.348.2 Macro Definition Documentation

7.348.2.1 CPU_USER_PROGRAM_STARTADDR_PTR

```
#define CPU_USER_PROGRAM_STARTADDR_PTR (NvmGetUserProgBaseAddress() - 2)
```

Start address of the user program. This is the address of the reset vector in the user program's vector table.

Attention

This value must be updated if the memory reserved for the bootloader changes.

Referenced by CpuStartUserProgram().

7.348.3 Function Documentation

7.348.3.1 CpuInit()

```
void CpuInit (  
    void )
```

Initializes the CPU module.

Returns

none.

7.348.3.2 CpuMemCopy()

```
void CpuMemCopy (  
    blt_addr dest,  
    blt_addr src,  
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

7.348.3.3 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

7.348.3.4 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

7.348.3.5 CpuUserProgramStartHook()

```
blt_bool CpuUserProgramStartHook (
    void )
```

Callback that gets called when the bootloader is about to exit and hand over control to the user program. This is the last moment that some final checking can be performed and if necessary prevent the bootloader from activating the user program.

Returns

BLT_TRUE if it is okay to start the user program, BLT_FALSE to keep keep the bootloader active.

Referenced by CpuStartUserProgram().

7.349 cpu.h File Reference

Bootloader cpu module header file.

This graph shows which files directly or indirectly include this file:

Functions

- void [CpuInit](#) (void)
Initializes the CPU module.
- void [CpuStartUserProgram](#) (void)
Starts the user program, if one is present. In this case this function does not return.
- void [CpuMemCopy](#) (blt_addr dest, blt_addr src, blt_int16u len)
Copies data from the source to the destination address.
- void [CpuMemSet](#) (blt_addr dest, blt_int8u value, blt_int16u len)
Sets the bytes at the destination address to the specified value.
- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.349.1 Detailed Description

Bootloader cpu module header file.

7.349.2 Function Documentation

7.349.2.1 CpuInit()

```
void CpuInit (
    void )
```

Initializes the CPU module.

Returns

none.

Referenced by [BootInit\(\)](#).

7.349.2.2 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

Referenced by CpuInit().

7.349.2.3 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

Referenced by CpuStartUserProgram().

7.349.2.4 CpuMemCopy()

```
void CpuMemCopy (
    blt_addr dest,
    blt_addr src,
    blt_int16u len )
```

Copies data from the source to the destination address.

Parameters

<i>dest</i>	Destination address for the data.
<i>src</i>	Source address of the data.
<i>len</i>	length of the data in bytes.

Returns

none.

Referenced by CpuStartUserProgram(), FlashInitBlock(), UsbReceivePacket(), XcpCmdGetSeed(), XcpCmdShortUpload(), XcpCmdUnlock(), and XcpCmdUpload().

7.349.2.5 CpuMemSet()

```
void CpuMemSet (
    blt_addr dest,
    blt_int8u value,
    blt_int16u len )
```

Sets the bytes at the destination address to the specified value.

Parameters

<i>dest</i>	Destination address for the data.
<i>value</i>	Value to write.
<i>len</i>	Number of bytes to write.

Returns

none.

Referenced by XcpCmdShortUpload(), and XcpCmdUpload().

7.349.2.6 CpuStartUserProgram()

```
void CpuStartUserProgram (
    void )
```

Starts the user program, if one is present. In this case this function does not return.

Returns

none.

Referenced by BackDoorCheck(), BackDoorInit(), FileTask(), and XcpCmdProgramReset().

Bootloader cpu module source file.

7.357.2 Function Documentation

7.357.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.357.2.2 CpulrQEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.358 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC00_STM32G0/Keil/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.358.1 Detailed Description

Bootloader cpu module source file.

7.358.2 Function Documentation

7.358.2.1 CpulrQDisable()

```
void CpuIrQDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.358.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.359 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include "cmsis_compiler.h"  
Include dependency graph for ARMCM0_XMC1/GCC/cpu_comp.c:
```

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.359.1 Detailed Description

Bootloader cpu module source file.

7.359.2 Function Documentation

7.359.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.359.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.360 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>
```

Include dependency graph for ARMCM0_XMC1/IAR/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.360.1 Detailed Description

Bootloader cpu module source file.

7.360.2 Function Documentation

7.360.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.360.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.361 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM33_STM32L5/GCC/cpu_comp.c:

Functions

- void [CpulrqDisable](#) (void)
Disable global interrupts.
- void [CpulrqEnable](#) (void)
Enable global interrupts.

7.361.1 Detailed Description

Bootloader cpu module source file.

7.361.2 Function Documentation

7.361.2.1 CpulrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.361.2.2 CpulrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.362 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

```
#include <intrinsics.h>
```

Include dependency graph for ARMCM33_STM32L5/IAR/cpu_comp.c:

Functions

- void [CpulrqDisable](#) (void)
Disable global interrupts.
- void [CpulrqEnable](#) (void)
Enable global interrupts.

7.362.1 Detailed Description

Bootloader cpu module source file.

7.362.2 Function Documentation

7.362.2.1 CpulrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.362.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.363 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM33_STM32L5/Keil/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.363.1 Detailed Description

Bootloader cpu module source file.

7.363.2 Function Documentation

7.363.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.363.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.364 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC32_EFM32/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.364.1 Detailed Description

Bootloader cpu module source file.

7.364.2 Function Documentation

7.364.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.364.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.365 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM3_EFM32/IAR/cpu_comp.c:
```

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.365.1 Detailed Description

Bootloader cpu module source file.

7.365.2 Function Documentation

7.365.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.365.2.2 CpulrQEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.366 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC3_LM3S/GCC/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.366.1 Detailed Description

Bootloader cpu module source file.

7.366.2 Function Documentation

7.366.2.1 CpulrQDisable()

```
void CpuIrQDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.366.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.367 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM3_LM3S/IAR/cpu_comp.c:
```

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.367.1 Detailed Description

Bootloader cpu module source file.

7.367.2 Function Documentation

7.367.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.367.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.368 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC3_STM32F1/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.368.1 Detailed Description

Bootloader cpu module source file.

7.368.2 Function Documentation

7.368.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.368.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.369 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM3_STM32F1/IAR/cpu_comp.c:
```

Functions

- void [CpulrqDisable](#) (void)
Disable global interrupts.
- void [CpulrqEnable](#) (void)
Enable global interrupts.

7.369.1 Detailed Description

Bootloader cpu module source file.

7.369.2 Function Documentation

7.369.2.1 CpulrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.369.2.2 CpulrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.370 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC3_STM32F1/Keil/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.370.1 Detailed Description

Bootloader cpu module source file.

7.370.2 Function Documentation

7.370.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.370.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.371 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM3_STM32F2/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.371.1 Detailed Description

Bootloader cpu module source file.

7.371.2 Function Documentation

7.371.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.371.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.372 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
#include <intrinsics.h>
```

Include dependency graph for ARMC32F2/IAR/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.372.1 Detailed Description

Bootloader cpu module source file.

7.372.2 Function Documentation

7.372.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.372.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.373 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM3_STM32F2/Keil/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.373.1 Detailed Description

Bootloader cpu module source file.

7.373.2 Function Documentation

7.373.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.373.2.2 CpulrQEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.374 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC4_S32K14/GCC/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.374.1 Detailed Description

Bootloader cpu module source file.

7.374.2 Function Documentation

7.374.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.374.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.375 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_S32K14/IAR/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.375.1 Detailed Description

Bootloader cpu module source file.

7.375.2 Function Documentation

7.375.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.375.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.376 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32F3/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.376.1 Detailed Description

Bootloader cpu module source file.

7.376.2 Function Documentation

7.376.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.376.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.377 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM4_STM32F3/IAR/cpu_comp.c:
```

Functions

- void [CpulrqDisable](#) (void)
Disable global interrupts.
- void [CpulrqEnable](#) (void)
Enable global interrupts.

7.377.1 Detailed Description

Bootloader cpu module source file.

7.377.2 Function Documentation

7.377.2.1 CpulrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.377.2.2 CpulrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.378 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC4_STM32F3/Keil/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.378.1 Detailed Description

Bootloader cpu module source file.

7.378.2 Function Documentation

7.378.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.378.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.379 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32F4/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.379.1 Detailed Description

Bootloader cpu module source file.

7.379.2 Function Documentation

7.379.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.379.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.380 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>
```

Include dependency graph for ARMCM4_STM32F4/IAR/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.380.1 Detailed Description

Bootloader cpu module source file.

7.380.2 Function Documentation

7.380.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.380.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.381 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32F4/Keil/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.381.1 Detailed Description

Bootloader cpu module source file.

7.381.2 Function Documentation

7.381.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.381.2.2 CpulrQEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.382 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC4_STM32L4/GCC/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.382.1 Detailed Description

Bootloader cpu module source file.

7.382.2 Function Documentation

7.382.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.382.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.383 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM4_STM32L4/IAR/cpu_comp.c:
```

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.383.1 Detailed Description

Bootloader cpu module source file.

7.383.2 Function Documentation

7.383.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.383.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.384 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_STM32L4/Keil/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.384.1 Detailed Description

Bootloader cpu module source file.

7.384.2 Function Documentation

7.384.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.384.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.385 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM4_TM4C/IAR/cpu_comp.c:
```

Functions

- void [CpulrqDisable](#) (void)
Disable global interrupts.
- void [CpulrqEnable](#) (void)
Enable global interrupts.

7.385.1 Detailed Description

Bootloader cpu module source file.

7.385.2 Function Documentation

7.385.2.1 CpulrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.385.2.2 CpulrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.386 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM4_XMC4/GCC/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.386.1 Detailed Description

Bootloader cpu module source file.

7.386.2 Function Documentation

7.386.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.386.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.387 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
#include <intrinsics.h>
Include dependency graph for ARMCM4_XMC4/IAR/cpu_comp.c:
```

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.387.1 Detailed Description

Bootloader cpu module source file.

7.387.2 Function Documentation

7.387.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.387.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.388 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC7_STM32F7/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.388.1 Detailed Description

Bootloader cpu module source file.

7.388.2 Function Documentation

7.388.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.388.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.389 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>  
Include dependency graph for ARMCM7_STM32F7/IAR/cpu_comp.c:
```

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.389.1 Detailed Description

Bootloader cpu module source file.

7.389.2 Function Documentation

7.389.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.389.2.2 CpulrQEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.390 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMC7_STM32F7/Keil/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.390.1 Detailed Description

Bootloader cpu module source file.

7.390.2 Function Documentation

7.390.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.390.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.391 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM7_STM32H7/GCC/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.391.1 Detailed Description

Bootloader cpu module source file.

7.391.2 Function Documentation

7.391.2.1 CpuIrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.391.2.2 CpuIrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.392 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"  
#include <intrinsics.h>
```

Include dependency graph for ARMCM7_STM32H7/IAR/cpu_comp.c:

Functions

- void [CpuIrqDisable](#) (void)
Disable global interrupts.
- void [CpuIrqEnable](#) (void)
Enable global interrupts.

7.392.1 Detailed Description

Bootloader cpu module source file.

7.392.2 Function Documentation

7.392.2.1 CpuIrqDisable()

```
void CpuIrqDisable (
    void )
```

Disable global interrupts.

Returns

none.

7.392.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.393 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for ARMCM7_STM32H7/Keil/cpu_comp.c:

Functions

- void [CpulrqDisable](#) (void)
Disable global interrupts.
- void [CpulrqEnable](#) (void)
Enable global interrupts.

7.393.1 Detailed Description

Bootloader cpu module source file.

7.393.2 Function Documentation

7.393.2.1 CpulrqDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.393.2.2 CpulrqEnable()

```
void CpuIrqEnable (  
    void )
```

Enable global interrupts.

Returns

none.

7.394 cpu_comp.c File Reference

Bootloader cpu module source file.

```
#include "boot.h"
```

Include dependency graph for HCS12/CodeWarrior/cpu_comp.c:

Functions

- void [CpulrQDisable](#) (void)
Disable global interrupts.
- void [CpulrQEnable](#) (void)
Enable global interrupts.

7.394.1 Detailed Description

Bootloader cpu module source file.

7.394.2 Function Documentation

7.394.2.1 CpulrQDisable()

```
void CpuIrqDisable (  
    void )
```

Disable global interrupts.

Returns

none.

7.394.2.2 CpuIrqEnable()

```
void CpuIrqEnable (
    void )
```

Enable global interrupts.

Returns

none.

7.395 cstart.c File Reference

Bootloader C startup source file.

```
#include "boot.h"
```

Include dependency graph for ARMC32_EFM32_Olimex_EM32G880F128STK_GCC/Boot/cstart.c:

Functions

- int [main](#) (void)

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

- void [reset_handler](#) (void)

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

7.395.1 Detailed Description

Bootloader C startup source file.

7.395.2 Function Documentation

7.395.2.1 main()

```
int main (
    void )
```

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

Returns

Program return code.
none.
Program exit code.
None.

7.395.2.2 reset_handler()

```
void reset_handler (
    void )
```

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

Returns

none.

7.396 cstart.c File Reference

Demo program C startup source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_EFM32_Olimex_EM32G880F128STK_GCC/Prog/cstart.c:

Functions

- int [main](#) (void)

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

- void [reset_handler](#) (void)

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

7.396.1 Detailed Description

Demo program C startup source file.

7.396.2 Function Documentation

7.396.2.1 main()

```
int main (  
    void )
```

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

Returns

Program return code.
none.
Program exit code.
None.

7.396.2.2 reset_handler()

```
void reset_handler (  
    void )
```

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

Returns

none.

7.397 cstart.c File Reference

Bootloader C startup source file.

```
#include "boot.h"
```

Include dependency graph for ARMC3_M3S_EK_M3S6965_GCC/Boot/cstart.c:

Functions

- int [main](#) (void)

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

- void [reset_handler](#) (void)

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

7.397.1 Detailed Description

Bootloader C startup source file.

7.397.2 Function Documentation

7.397.2.1 main()

```
int main (  
    void )
```

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

Returns

Program return code.
none.
Program exit code.
None.

7.397.2.2 reset_handler()

```
void reset_handler (  
    void )
```

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

Returns

none.

7.398.2.2 reset_handler()

```
void reset_handler (
    void )
```

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

Returns

none.

7.399 cstart.c File Reference

Bootloader C startup source file.

```
#include "boot.h"
```

Include dependency graph for ARMC3M3_LM3S_EK_LM3S8962_GCC/Boot/cstart.c:

Functions

- int [main](#) (void)

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

- void [reset_handler](#) (void)

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

7.399.1 Detailed Description

Bootloader C startup source file.

7.399.2 Function Documentation

7.399.2.1 main()

```
int main (
                                void )
```

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

Returns

Program return code.
none.
Program exit code.
None.

7.399.2.2 reset_handler()

```
void reset_handler (
    void )
```

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

Returns

none.

7.400 cstart.c File Reference

Demo program C startup source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3_LM3S_EK_LM3S8962_GCC/Prog/cstart.c:

Functions

- int [main](#) (void)
This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.
- void [reset_handler](#) (void)
Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

7.400.1 Detailed Description

Demo program C startup source file.

7.400.2 Function Documentation

7.400.2.1 main()

```
int main (
    void )
```

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

Returns

Program return code.
none.
Program exit code.
None.

7.400.2.2 reset_handler()

```
void reset_handler (
    void )
```

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

Returns

none.

7.401 file.c File Reference

Bootloader file system interface source file.

```
#include "boot.h"
#include <string.h>
#include <ctype.h>
Include dependency graph for file.c:
```

Data Structures

- struct [tFileEraseInfo](#)
Structure type with information for the memory erase operation.
- struct [tFatFsObjects](#)
Structure type for grouping FATFS related objects used by this module.

Enumerations

- enum [tFirmwareUpdateState](#) { [FIRMWARE_UPDATE_STATE_IDLE](#), [FIRMWARE_UPDATE_STATE_STARTING](#), [FIRMWARE_UPDATE_STATE_ERASING](#), [FIRMWARE_UPDATE_STATE_PROGRAMMING](#) }
Enumeration for the different internal module states.

Functions

- static [blt_char](#) [FileLibByteNibbleToChar](#) ([blt_int8u](#) nibble)
Helper function to convert a 4-bit value to a character that represents its value in hexadecimal format. Example: FileLibByteNibbleToChar(11) -> returns 'B'.
- static [blt_char](#) * [FileLibByteToHexString](#) ([blt_int8u](#) byte_val, [blt_char](#) *destination)
Helper function to convert a byte value to a string representing the value in hexadecimal format. Example: FileLibByteToHexString(28, strBuffer) -> returns "1C".
- static [blt_char](#) * [FileLibLongToIntString](#) ([blt_int32u](#) long_val, [blt_char](#) *destination)
Helper function to convert a 32-bit unsigned number to a string that represents its decimal value. Example: FileLibLongToIntString(1234, strBuffer) -> returns "1234".
- static [blt_int8u](#) [FileLibHexStringToByte](#) (const [blt_char](#) *hexstring)
Helper function to convert a sequence of 2 characters that represent a hexadecimal value to the actual byte value. Example: FileLibHexStringToByte("2f") -> returns 47.
- [blt_bool](#) [FileIsFirmwareUpdateRequestedHook](#) (void)
Callback that gets called to check whether a firmware update from local file storage should be started. This could for example be when a switch is pressed, when a certain file is found on the local file storage, etc.
- const [blt_char](#) * [FileGetFirmwareFilenameHook](#) (void)
Callback to obtain the filename of the firmware file that should be used during the firmware update from the local file storage. This hook function is called at the beginning of the firmware update from local storage sequence.
- void [FileFirmwareUpdateStartedHook](#) (void)
Callback that gets called to inform the application that a firmware update from local storage just started.
- void [FileFirmwareUpdateCompletedHook](#) (void)
Callback that gets called to inform the application that a firmware update was successfully completed.
- void [FileFirmwareUpdateErrorHook](#) ([blt_int8u](#) error_code)
Callback that gets called in case an error occurred during a firmware update. Refer to <file.h> for a list of available error codes.
- void [FileFirmwareUpdateLogHook](#) ([blt_char](#) *info_string)
Callback that gets called each time new log information becomes available during a firmware update.
- void [FileInit](#) (void)
Initializes the file system interface module. The initial firmware update state is set to idle and the file system is mounted as logical disk 0.
- [blt_bool](#) [FileIsIdle](#) (void)
This function checks if a firmware update through the locally attached storage is in progress or not (idle).
- [blt_bool](#) [FileHandleFirmwareUpdateRequest](#) (void)
This function checks if a firmware update through the locally attached storage is requested to be started and if so processes this request by transitioning from the IDLE to the STARTING state.
- void [FileTask](#) (void)

File system task function for managing the firmware updates from locally attached storage.

- [tSrecLineType](#) [FileSrecGetLineType](#) (const [blt_char](#) *line)
Inspects a line from a Motorola S-Record file to determine its type.
- [blt_bool](#) [FileSrecVerifyChecksum](#) (const [blt_char](#) *line)
Inspects an S1, S2 or S3 line from a Motorola S-Record file to determine if the checksum at the end is correct.
- [blt_int16s](#) [FileSrecParseLine](#) (const [blt_char](#) *line, [blt_addr](#) *address, [blt_int8u](#) *data)
Parses a line from a Motorola S-Record file and looks for S1, S2 or S3 lines with data. Note that if a null pointer is passed as the data parameter, then no data is extracted from the line.

Variables

- static [tFirmwareUpdateState](#) [firmwareUpdateState](#)
Local variable that holds the internal module state.
- static [tFatFsObjects](#) [fatFsObjects](#)
Local variable for the used FATFS objects in this module.
- static [tSrecLineParseObject](#) [lineParseObject](#)
Local variable for storing S-record line parsing results.
- static [tFileEraseInfo](#) [eraseInfo](#)
Local variable for storing information regarding the memory erase operation.
- static [blt_char](#) [loggingStr](#) [64]
Local character buffer for storing the string with log information.

7.401.1 Detailed Description

Bootloader file system interface source file.

7.401.2 Enumeration Type Documentation

7.401.2.1 tFirmwareUpdateState

```
enum tFirmwareUpdateState
```

Enumeration for the different internal module states.

Enumerator

FIRMWARE_UPDATE_STATE_IDLE	idle state
FIRMWARE_UPDATE_STATE_STARTING	starting state
FIRMWARE_UPDATE_STATE_ERASING	erasing state
FIRMWARE_UPDATE_STATE_PROGRAMMING	programming state

7.401.3 Function Documentation

7.401.3.1 FileFirmwareUpdateCompletedHook()

```
void FileFirmwareUpdateCompletedHook (  
    void )
```

Callback that gets called to inform the application that a firmware update was successfully completed.

Returns

none.

Referenced by FileTask().

7.401.3.2 FileFirmwareUpdateErrorHook()

```
void FileFirmwareUpdateErrorHook (  
    blt_int8u error_code )
```

Callback that gets called in case an error occurred during a firmware update. Refer to <[file.h](#)> for a list of available error codes.

Returns

none.

Referenced by FileTask().

7.401.3.3 FileFirmwareUpdateLogHook()

```
void FileFirmwareUpdateLogHook (  
    blt_char * info_string )
```

Callback that gets called each time new log information becomes available during a firmware update.

Parameters

<i>info_string</i>	Pointer to a character array with the log entry info.
--------------------	---

Returns

none.

Referenced by FileTask().

7.401.3.4 FileFirmwareUpdateStartedHook()

```
void FileFirmwareUpdateStartedHook (  
    void )
```

Callback that gets called to inform the application that a firmware update from local storage just started.

Returns

none.

Referenced by FileTask().

7.401.3.5 FileGetFirmwareFilenameHook()

```
const blt_char* FileGetFirmwareFilenameHook (  
    void )
```

Callback to obtain the filename of the firmware file that should be used during the firmware update from the local file storage. This hook function is called at the beginning of the firmware update from local storage sequence.

Returns

valid firmware filename with full path or BLT_NULL.

Referenced by FileTask().

7.401.3.6 FileHandleFirmwareUpdateRequest()

```
blt_bool FileHandleFirmwareUpdateRequest (  
    void )
```

This function checks if a firmware update through the locally attached storage is requested to be started and if so processes this request by transitioning from the IDLE to the STARTING state.

Returns

BLT_TRUE when a firmware update is requested, BLT_FALSE otherwise.

Referenced by BackDoorCheck(), and BackDoorInit().

7.401.3.7 FileInit()

```
void FileInit (
    void )
```

Initializes the file system interface module. The initial firmware update state is set to idle and the file system is mounted as logical disk 0.

Returns

none

Referenced by BootInit().

7.401.3.8 FileIsFirmwareUpdateRequestedHook()

```
blt_bool FileIsFirmwareUpdateRequestedHook (
    void )
```

Callback that gets called to check whether a firmware update from local file storage should be started. This could for example be when a switch is pressed, when a certain file is found on the local file storage, etc.

Returns

BLT_TRUE if a firmware update is requested, BLT_FALSE otherwise.

Referenced by FileHandleFirmwareUpdateRequest().

7.401.3.9 FileIsIdle()

```
blt_bool FileIsIdle (
    void )
```

This function checks if a firmware update through the locally attached storage is in progress or not (idle).

Returns

BLT_TRUE when in idle state, BLT_FALSE otherwise.

Referenced by BackDoorCheck(), and XcpCmdConnect().

7.401.3.10 FileLibByteNibbleToChar()

```
static blt_char FileLibByteNibbleToChar (
    blt_int8u nibble ) [static]
```

Helper function to convert a 4-bit value to a character that represents its value in hexadecimal format. Example: FileLibByteNibbleToChar(11) -> returns 'B'.

Parameters

<i>nibble</i>	4-bit value to convert.
---------------	-------------------------

Returns

The resulting byte value.

Referenced by FileLibByteToHexString().

7.401.3.11 FileLibByteToHexString()

```
static blt_char * FileLibByteToHexString (
    blt_int8u byte_val,
    blt_char * destination ) [static]
```

Helper function to convert a byte value to a string representing the value in hexadecimal format. Example: FileLibByteToHexString(28, strBuffer) -> returns "1C".

Parameters

<i>byte_val</i>	8-bit value to convert.
<i>destination</i>	Pointer to character buffer for storing the results.

Returns

The resulting string.

Referenced by FileTask().

7.401.3.12 FileLibHexStringToByte()

```
static blt_int8u FileLibHexStringToByte (
    const blt_char * hexstring ) [static]
```

Helper function to convert a sequence of 2 characters that represent a hexadecimal value to the actual byte value. Example: FileLibHexStringToByte("2f") -> returns 47.

Parameters

<i>hexstring</i>	String beginning with 2 characters that represent a hexa- decimal value.
------------------	--

Returns

The resulting byte value.

Referenced by FileSrecParseLine(), and FileSrecVerifyChecksum().

7.401.3.13 FileLibLongToIntString()

```
static blt_char * FileLibLongToIntString (
    blt_int32u long_val,
    blt_char * destination ) [static]
```

Helper function to convert a 32-bit unsigned number to a string that represents its decimal value. Example: File↵
LibLongToIntString(1234, strBuffer) -> returns "1234".

Parameters

<i>long_val</i>	32-bit value to convert.
<i>destination</i>	Pointer to character buffer for storing the results.

Returns

The resulting string.

Referenced by FileTask().

7.401.3.14 FileSrecGetLineType()

```
tSrecLineType FileSrecGetLineType (
    const blt_char * line )
```

Inspects a line from a Motorola S-Record file to determine its type.

Parameters

<i>line</i>	A line from the S-Record.
-------------	---------------------------

Returns

the S-Record line type.

Referenced by FileSrecParseLine().

7.401.3.15 FileSrecParseLine()

```
blt_int16s FileSrecParseLine (
    const blt_char * line,
    blt_addr * address,
    blt_int8u * data )
```

Parses a line from a Motorola S-Record file and looks for S1, S2 or S3 lines with data. Note that if a null pointer is passed as the data parameter, then no data is extracted from the line.

Parameters

<i>line</i>	A line from the S-Record.
<i>address</i>	Address found in the S-Record data line.
<i>data</i>	Byte array where the data bytes from the S-Record data line are stored.

Returns

The number of data bytes found on the S-record data line, 0 in case the line is not an S1, S2 or S3 line or ERROR_SREC_INVALID_CHECKSUM in case the checksum validation failed.

Referenced by FileTask().

7.401.3.16 FileSrecVerifyChecksum()

```
blt_bool FileSrecVerifyChecksum (
    const blt_char * line )
```

Inspects an S1, S2 or S3 line from a Motorola S-Record file to determine if the checksum at the end is correct.

Parameters

<i>line</i>	An S1, S2 or S3 line from the S-Record.
-------------	---

Returns

BLT_TRUE if the checksum is correct, BLT_FALSE otherwise.

Referenced by FileSrecParseLine().

7.401.3.17 FileTask()

```
void FileTask (
    void )
```

File system task function for managing the firmware updates from locally attached storage.

Returns

none.

Referenced by BootTask().

7.402 file.h File Reference

Bootloader file system interface header file.

```
#include "ff.h"
```

Include dependency graph for file.h:

This graph shows which files directly or indirectly include this file:

**Data Structures**

- struct [tSrecLineParseObject](#)
Structure type for grouping the parsing results of an S-record line.

Macros

- #define [FILE_ERROR_CANNOT_OPEN_FIRMWARE_FILE](#) (1)
Error code for not being able to open the firmware file.
- #define [FILE_ERROR_CANNOT_READ_FROM_FILE](#) (2)
Error code for not being able to read from the firmware file.
- #define [FILE_ERROR_INVALID_CHECKSUM_IN_FILE](#) (3)
Error code because in incorrect checksum was found in the firmware file.
- #define [FILE_ERROR_REWINDING_FILE_READ_POINTER](#) (4)
Error code because the file pointers read pointer could not be rewinded.
- #define [FILE_ERROR_CANNOT_ERASE_MEMORY](#) (5)

- Error code because an error occurred during the memory erase operation.*
 - `#define FILE_ERROR_CANNOT_PROGRAM_MEMORY` (6)
- Error code because an error occurred during the memory write operation.*
 - `#define FILE_ERROR_CANNOT_WRITE_CHECKSUM` (7)
- Error code because the program's checksum could not be written to memory.*
 - `#define MAX_CHARS_PER_LINE` (256)
- Maximum number of characters that can be on a line in the firmware file.*
 - `#define MAX_DATA_BYTES_PER_LINE` (`MAX_CHARS_PER_LINE/2`)
- Maximum number of data bytes that can be on a line in the firmware file (S-record).*
 - `#define ERROR_SREC_INVALID_CHECKSUM` (-1)
- Return code in case an invalid checksum was detected on an S-record line.*

Enumerations

- `enum tSrecLineType { LINE_TYPE_S1, LINE_TYPE_S2, LINE_TYPE_S3, LINE_TYPE_UNSUPPORTED }`
Enumeration for the different S-record line types.

Functions

- `void FileInit` (void)
Initializes the file system interface module. The initial firmware update state is set to idle and the file system is mounted as logical disk 0.
- `void FileTask` (void)
File system task function for managing the firmware updates from locally attached storage.
- `blt_bool FileIsIdle` (void)
This function checks if a firmware update through the locally attached storage is in progress or not (idle).
- `blt_bool FileHandleFirmwareUpdateRequest` (void)
This function checks if a firmware update through the locally attached storage is requested to be started and if so processes this request by transitioning from the IDLE to the STARTING state.
- `tSrecLineType FileSrecGetLineType` (const `blt_char` *line)
Inspects a line from a Motorola S-Record file to determine its type.
- `blt_bool FileSrecVerifyChecksum` (const `blt_char` *line)
Inspects an S1, S2 or S3 line from a Motorola S-Record file to determine if the checksum at the end is correct.
- `blt_int16s FileSrecParseLine` (const `blt_char` *line, `blt_addr` *address, `blt_int8u` *data)
Parses a line from a Motorola S-Record file and looks for S1, S2 or S3 lines with data. Note that if a null pointer is passed as the data parameter, then no data is extracted from the line.

7.402.1 Detailed Description

Bootloader file system interface header file.

7.402.2 Enumeration Type Documentation

7.402.2.1 tSrecLineType

```
enum tSrecLineType
```

Enumeration for the different S-record line types.

Enumerator

LINE_TYPE_S1	16-bit address line
LINE_TYPE_S2	24-bit address line
LINE_TYPE_S3	32-bit address line
LINE_TYPE_UNSUPPORTED	unsupported line

7.402.3 Function Documentation

7.402.3.1 FileHandleFirmwareUpdateRequest()

```
blt_bool FileHandleFirmwareUpdateRequest (  
    void )
```

This function checks if a firmware update through the locally attached storage is requested to be started and if so processes this request by transitioning from the IDLE to the STARTING state.

Returns

BLT_TRUE when a firmware update is requested, BLT_FALSE otherwise.

Referenced by BackDoorCheck(), and BackDoorInit().

7.402.3.2 FileInit()

```
void FileInit (  
    void )
```

Initializes the file system interface module. The initial firmware update state is set to idle and the file system is mounted as logical disk 0.

Returns

none

Referenced by BootInit().

7.402.3.3 FileIsIdle()

```
blt_bool FileIsIdle (
    void )
```

This function checks if a firmware update through the locally attached storage is in progress or not (idle).

Returns

BLT_TRUE when in idle state, BLT_FALSE otherwise.

Referenced by BackDoorCheck(), and XcpCmdConnect().

7.402.3.4 FileSrecGetLineType()

```
tSrecLineType FileSrecGetLineType (
    const blt_char * line )
```

Inspects a line from a Motorola S-Record file to determine its type.

Parameters

<i>line</i>	A line from the S-Record.
-------------	---------------------------

Returns

the S-Record line type.

Referenced by FileSrecParseLine().

7.402.3.5 FileSrecParseLine()

```
blt_int16s FileSrecParseLine (
    const blt_char * line,
    blt_addr * address,
    blt_int8u * data )
```

Parses a line from a Motorola S-Record file and looks for S1, S2 or S3 lines with data. Note that if a null pointer is passed as the data parameter, then no data is extracted from the line.

Parameters

<i>line</i>	A line from the S-Record.
<i>address</i>	Address found in the S-Record data line.
<i>data</i>	Byte array where the data bytes from the S-Record data line are stored.

Returns

The number of data bytes found on the S-record data line, 0 in case the line is not an S1, S2 or S3 line or `ERROR_SREC_INVALID_CHECKSUM` in case the checksum validation failed.

Referenced by `FileTask()`.

7.402.3.6 FileSrecVerifyChecksum()

```
blt_bool FileSrecVerifyChecksum (
    const blt_char * line )
```

Inspects an S1, S2 or S3 line from a Motorola S-Record file to determine if the checksum at the end is correct.

Parameters

<i>line</i>	An S1, S2 or S3 line from the S-Record.
-------------	---

Returns

`BLT_TRUE` if the checksum is correct, `BLT_FALSE` otherwise.

Referenced by `FileSrecParseLine()`.

7.402.3.7 FileTask()

```
void FileTask (
    void )
```

File system task function for managing the firmware updates from locally attached storage.

Returns

none.

Referenced by `BootTask()`.

7.403 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
```

Include dependency graph for _template/flash.c:

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR_IDX](#) (0xff)
Value for an invalid sector entry index into flashLayout[].
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x188)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static `blt_bool` `FlashInitBlock` (`tFlashBlockInfo` *block, `blt_addr` address)
Copies data currently in flash to the block->data and sets the base address.
- static `tFlashBlockInfo` * `FlashSwitchBlock` (`tFlashBlockInfo` *block, `blt_addr` base_addr)
Switches blocks by programming the current one and initializing the next.
- static `blt_bool` `FlashAddToBlock` (`tFlashBlockInfo` *block, `blt_addr` address, `blt_int8u` *data, `blt_int32u` len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static `blt_bool` `FlashWriteBlock` (`tFlashBlockInfo` *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static `blt_bool` `FlashEraseSectors` (`blt_int8u` first_sector_idx, `blt_int8u` last_sector_idx)
Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.
- static `blt_int8u` `FlashGetSectorIdx` (`blt_addr` address)
Determines the index into the flashLayout[] array of the flash sector that the specified address is in.
- void `FlashInit` (void)
Initializes the flash driver.
- void `FlashReinit` (void)
Reinitializes the flash driver.
- `blt_bool` `FlashWrite` (`blt_addr` addr, `blt_int32u` len, `blt_int8u` *data)
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool` `FlashErase` (`blt_addr` addr, `blt_int32u` len)
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool` `FlashWriteChecksum` (void)
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool` `FlashVerifyChecksum` (void)
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool` `FlashDone` (void)
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr` `FlashGetUserProgBaseAddress` (void)
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector` `flashLayout` []
If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo` `blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo` `bootBlockInfo`
Local variable with information about the flash boot block.

7.403.1 Detailed Description

Bootloader flash driver source file.

7.403.2 Function Documentation

7.403.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.403.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by NvmDone().

7.403.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by NvmErase().

7.403.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector_idx,  
    blt_int8u last_sector_idx ) [static]
```

Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.

Parameters

<i>first_sector_idx</i>	First flash sector number index into flashLayout[].
<i>last_sector_idx</i>	Last flash sector number index into flashLayout[].

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.403.2.5 FlashGetSectorIdx()

```
static blt_int8u FlashGetSectorIdx (  
    blt_addr address ) [static]
```

Determines the index into the flashLayout[] array of the flash sector that the specified address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector index in flashLayout[] or FLASH_INVALID_SECTOR_IDX.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.403.2.6 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

Referenced by NvmGetUserProgBaseAddress().

7.403.2.7 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

Referenced by NvmInit().

7.403.2.8 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.403.2.9 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

Referenced by NvmReinit().

7.403.2.10 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is now being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.403.2.11 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by NvmVerifyChecksum().

7.403.2.12 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum(), and NvmWrite().

7.403.2.13 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.403.2.14 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by NvmDone().

7.403.3 Variable Documentation

7.403.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.403.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. It is likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block needs to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way it is possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.403.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

Initial value:

```
=
{

    { 0x08008000, 0x04000, 2},
    { 0x0800C000, 0x04000, 3},

    { 0x08010000, 0x04000, 4},
    { 0x08014000, 0x04000, 5},
    { 0x08018000, 0x04000, 6},
    { 0x0801C000, 0x04000, 7},

    { 0x08020000, 0x04000, 8},
    { 0x08024000, 0x04000, 9},
    { 0x08028000, 0x04000, 10},
    { 0x0802C000, 0x04000, 11},
    { 0x08030000, 0x04000, 12},
    { 0x08034000, 0x04000, 13},
    { 0x08038000, 0x04000, 14},
    { 0x0803C000, 0x04000, 15},

}
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.404 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "device_registers.h"
Include dependency graph for ARMCM0_S32K11/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.

7.404.1 Detailed Description

Bootloader flash driver source file.

7.404.2 Function Documentation

7.404.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.404.2.2 FlashCommandSequence()

```
static START_FUNCTION_DEFINITION_RAMSECTION void FlashCommandSequence (  
    void ) [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Use the FTFC module to run the flash command sequence. It is assumed that that command and its necessary parameters were already written to the correct FTFC registers.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

Attention

This function needs to run from RAM. It is configured such that the C start-up code automatically copies it from ROM to RAM in function `init_data_bss()`, which is called by the reset handler.

Returns

None.

Referenced by FlashEraseSectors(), FlashGetSectorIdx(), and FlashWriteBlock().

7.404.2.3 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.404.2.4 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.404.2.5 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector_idx,  
    blt_int8u last_sector_idx ) [static]
```

Erases the flash sectors from indices *first_sector_idx* up until *last_sector_idx* into the *flashLayout[]* array.

Parameters

<i>first_sector_idx</i>	First flash sector number index into <i>flashLayout[]</i> .
<i>last_sector_idx</i>	Last flash sector number index into <i>flashLayout[]</i> .

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.404.2.6 FlashGetSectorIdx()

```
static blt_int8u FlashGetSectorIdx (  
    blt_addr address ) [static]
```

Determines the index into the flashLayout[] array of the flash sector that the specified address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector index in flashLayout[] or FLASH_INVALID_SECTOR_IDX.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.404.2.7 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.404.2.8 FlashInit()

```
void FlashInit (  
    void )
```

Initializes the flash driver.

Returns

none.

7.404.2.9 FlashInitBlock()

```
static blt_bool FlashInitBlock (  
    tFlashBlockInfo * block,  
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.404.2.10 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.404.2.11 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is now being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.404.2.12 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.404.2.13 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.404.2.14 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.404.2.15 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.404.3 Variable Documentation

7.404.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.404.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. It is likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block needs to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way it is possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.405 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "stm32f0xx.h"
Include dependency graph for ARMCM0_STM32F0/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [FLASH_ERASE_BLOCK_SIZE](#) (0x800)
Number of bytes to erase per erase operation.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0xC0)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static `blt_bool FlashInitBlock` (`tFlashBlockInfo *block`, `blt_addr` address)
Copies data currently in flash to the block->data and sets the base address.
- static `tFlashBlockInfo * FlashSwitchBlock` (`tFlashBlockInfo *block`, `blt_addr` base_addr)
Switches blocks by programming the current one and initializing the next.
- static `blt_bool FlashAddToBlock` (`tFlashBlockInfo *block`, `blt_addr` address, `blt_int8u *data`, `blt_int32u` len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static `blt_bool FlashWriteBlock` (`tFlashBlockInfo *block`)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static `blt_bool FlashEraseSectors` (`blt_int8u` first_sector, `blt_int8u` last_sector)
Erases the flash sectors from first_sector up until last_sector.
- static `blt_int8u FlashGetSector` (`blt_addr` address)
Determines the flash sector the address is in.
- static `blt_addr FlashGetSectorBaseAddr` (`blt_int8u` sector)
Determines the flash sector base address.
- static `blt_addr FlashGetSectorSize` (`blt_int8u` sector)
Determines the flash sector size.
- void `FlashInit` (void)
Initializes the flash driver.
- void `FlashReinit` (void)
Reinitializes the flash driver.
- `blt_bool FlashWrite` (`blt_addr` addr, `blt_int32u` len, `blt_int8u *data`)
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase` (`blt_addr` addr, `blt_int32u` len)
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum` (void)
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum` (void)
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone` (void)
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress` (void)
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector flashLayout` []
If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`
Local variable with information about the flash boot block.

7.405.1 Detailed Description

Bootloader flash driver source file.

7.405.2 Function Documentation

7.405.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.405.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.405.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.405.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector,  
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from first_sector up until last_sector.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.405.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (  
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.405.2.6 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (  
    blt_int8u sector ) [static]
```

Determines the flash sector base address.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Flash sector base address or FLASH_INVALID_ADDRESS.

Referenced by FlashEraseSectors().

7.405.2.7 FlashGetSectorSize()

```
static blt_addr FlashGetSectorSize (  
    blt_int8u sector ) [static]
```

Determines the flash sector size.

Parameters

<i>sector</i>	Sector to get the size of.
---------------	----------------------------

Returns

Flash sector size or 0.

Referenced by FlashEraseSectors().

7.405.2.8 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.405.2.9 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.405.2.10 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.405.2.11 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.405.2.12 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.405.2.13 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.405.2.14 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.405.2.15 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.405.2.16 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.405.3 Variable Documentation

7.405.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.405.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.405.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. The current flash layout does not reflect the minimum sector size of the physical flash (1 - 2kb), because this would make the table quit long and a waste of ROM. The minimum sector size is only really needed when erasing the flash. This can still be done in combination with macro `FLASH_ERASE_BLOCK_SIZE`. Note that the term sector here is used in a different meaning than in the controller's reference manual.

7.406 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "stm32g0xx.h"
Include dependency graph for ARMCM0_STM32G0/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

7.406.1 Detailed Description

Bootloader flash driver source file.

7.406.2 Function Documentation

7.406.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.406.2.2 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.406.2.3 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.406.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector,
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from `first_sector` up until `last_sector`.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.406.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.406.2.6 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (
    blt_int8u sector ) [static]
```

Determines the flash sector base address.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Flash sector base address or FLASH_INVALID_ADDRESS.

Referenced by FlashEraseSectors().

7.406.2.7 FlashGetSectorSize()

```
static blt_addr FlashGetSectorSize (  
    blt_int8u sector ) [static]
```

Determines the flash sector size.

Parameters

<i>sector</i>	Sector to get the size of.
---------------	----------------------------

Returns

Flash sector size or 0.

Referenced by FlashEraseSectors().

7.406.2.8 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.406.2.9 FlashInit()

```
void FlashInit (  
    void )
```

Initializes the flash driver.

Returns

none.

7.406.2.10 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.406.2.11 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.406.2.12 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is now being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.406.2.13 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.406.2.14 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.406.2.15 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.406.2.16 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.406.3 Variable Documentation

7.406.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.406.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.406.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. The current flash layout does not reflect the minimum sector size of the physical flash (2 KiB), because this would make the table quite long and a waste of ROM. The minimum sector size is only really needed when erasing the flash. This can still be done in combination with macro `FLASH_ERASE_BLOCK_SIZE`. Note that the term sector here is used in a different meaning than in the controller's reference manual.

7.407 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "xmc_flash.h"
Include dependency graph for ARMCM0_XMC1/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (256)
Standard size of a flash block for writing. It should be large enough so that the OpenBLT checksum fits in the first (boot) block). Note that this value is set to the hardware defined size of a XMC1 flash page.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x018)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.
- #define [FLASH_ERASE_TIME_MAX_MS](#) (10)
Maximum time for a sector erase operation as specified by the XCM1xxx data- sheet with an added 20% margin.
- #define [FLASH_PROGRAM_TIME_MAX_MS](#) (5)
Maximum time for a page program operation as specified by the XCM1xxx data- sheet with an added 20% margin.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static [blt_bool](#) [FlashEraseSectors](#) ([blt_int8u](#) first_sector, [blt_int8u](#) last_sector)
Erases the flash sectors from first_sector up until last_sector.
- static [blt_int8u](#) [FlashGetSector](#) ([blt_addr](#) address)
Determines the flash sector the address is in.
- static [blt_addr](#) [FlashGetSectorBaseAddr](#) ([blt_int8u](#) sector)
Obtains the base address of the specified sector.
- void [FlashInit](#) (void)
Initializes the flash driver.
- void [FlashReinit](#) (void)

Reinitializes the flash driver.

- `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase (blt_addr addr, blt_int32u len)`
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum (void)`
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum (void)`
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone (void)`
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress (void)`
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector flashLayout []`
If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`
Local variable with information about the flash boot block.

7.407.1 Detailed Description

Bootloader flash driver source file.

7.407.2 Function Documentation

7.407.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.407.2.2 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.407.2.3 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.407.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector,
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from first_sector up until last_sector.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.407.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.407.2.6 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (
    blt_int8u sector ) [static]
```

Obtains the base address of the specified sector.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Base Base address of the sector if found, FLASH_INVALID_ADDRESS otherwise.

Referenced by FlashEraseSectors().

7.407.2.7 FlashGetUserProgBaseAddress()

```
b1t_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.407.2.8 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.407.2.9 FlashInitBlock()

```
static b1t_bool FlashInitBlock (
    tFlashBlockInfo * block,
    b1t_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.407.2.10 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.407.2.11 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.407.2.12 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.407.2.13 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.407.2.14 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.407.2.15 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.407.3 Variable Documentation

7.407.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.407.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. It is likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block needs to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way it is possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.407.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. Note that the table contains uncached addresses, because flash program/erase operations need to be performed on uncached addresses. This flash driver automatically translated cached to uncached addresses, so there is no need for the user to adjust this when calling this driver's API.

7.408 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
```

```
#include "stm32l5xx.h"
```

Include dependency graph for ARMCM33_STM32L5/flash.c:

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR_IDX](#) (0xff)
Value for an invalid sector entry index into flashLayout[].
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x1F4)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static `blt_bool FlashInitBlock` (`tFlashBlockInfo *block`, `blt_addr` address)
Copies data currently in flash to the block->data and sets the base address.
- static `tFlashBlockInfo * FlashSwitchBlock` (`tFlashBlockInfo *block`, `blt_addr` base_addr)
Switches blocks by programming the current one and initializing the next.
- static `blt_bool FlashAddToBlock` (`tFlashBlockInfo *block`, `blt_addr` address, `blt_int8u *data`, `blt_int32u` len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static `blt_bool FlashWriteBlock` (`tFlashBlockInfo *block`)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static `blt_bool FlashEraseSectors` (`blt_int8u` first_sector_idx, `blt_int8u` last_sector_idx)
Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.
- static `blt_int8u FlashGetSectorIdx` (`blt_addr` address)
Determines the index into the flashLayout[] array of the flash sector that the specified address is in.
- static `blt_int32u FlashGetPageSize` (void)
Determines the size of a flash pages, defined by hardware. This also defines the minimal erase size.
- static `blt_bool FlashIsDualBankMode` (void)
Determines if the flash device is configured as dual bank mode or single bank mode.
- static `blt_int32u FlashGetBank` (`blt_addr` address)
Determines the flash bank that the address belongs to.
- static `blt_int32u FlashGetPage` (`blt_addr` address)
Determines the flash page that the address belongs to.
- void `FlashInit` (void)
Initializes the flash driver.
- void `FlashReinit` (void)
Reinitializes the flash driver.
- `blt_bool FlashWrite` (`blt_addr` addr, `blt_int32u` len, `blt_int8u *data`)
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase` (`blt_addr` addr, `blt_int32u` len)
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum` (void)
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum` (void)
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone` (void)
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress` (void)
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector flashLayout` []
If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`
Local variable with information about the flash boot block.

7.408.1 Detailed Description

Bootloader flash driver source file.

7.408.2 Function Documentation

7.408.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.408.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.408.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.408.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector_idx,
    blt_int8u last_sector_idx ) [static]
```

Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.

Parameters

<i>first_sector_idx</i>	First flash sector number index into flashLayout[].
<i>last_sector_idx</i>	Last flash sector number index into flashLayout[].

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.408.2.5 FlashGetBank()

```
static blt_int32u FlashGetBank (
    blt_addr address ) [static]
```

Determines the flash bank that the address belongs to.

Parameters

<i>address</i>	Flash memory address.
----------------	-----------------------

Returns

FLASH_BANK_1 if the address belongs to bank 1, FLASH_BANK_2 otherwise.

Referenced by FlashEraseSectors(), and FlashGetPage().

7.408.2.6 FlashGetPage()

```
static blt_int32u FlashGetPage (
    blt_addr address ) [static]
```

Determines the flash page that the address belongs to.

end of FlashGetBank

Parameters

<i>address</i>	Flash memory address.
----------------	-----------------------

Returns

Page number.

Referenced by FlashEraseSectors().

7.408.2.7 FlashGetPageSize()

```
static blt_int32u FlashGetPageSize (
    void ) [static]
```

Determines the size of a flash pages, defined by hardware. This also defines the minimal erase size.

Returns

Size of a flash page.

Referenced by FlashEraseSectors(), and FlashGetPage().

7.408.2.8 FlashGetSectorIdx()

```
static blt_int8u FlashGetSectorIdx (
    blt_addr address ) [static]
```

Determines the index into the flashLayout[] array of the flash sector that the specified address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector index in flashLayout[] or FLASH_INVALID_SECTOR_IDX.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.408.2.9 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.408.2.10 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.408.2.11 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.408.2.12 FlashIsDualBankMode()

```
static blt_bool FlashIsDualBankMode (  
    void ) [static]
```

Determines if the flash device is configured as dual bank mode or single bank mode.

Returns

BLT_TRUE if configured as dual bank mode, BLT_FALSE for single bank mode.

Referenced by FlashGetBank(), FlashGetPage(), and FlashGetPageSize().

7.408.2.13 FlashReinit()

```
void FlashReinit (  
    void )
```

Reinitializes the flash driver.

Returns

none.

7.408.2.14 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (  
    tFlashBlockInfo * block,  
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is now being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.408.2.15 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.408.2.16 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.408.2.17 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.408.2.18 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.408.3 Variable Documentation

7.408.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.408.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.408.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array wit the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.409 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"  
#include "efm32_msc.h"  
Include dependency graph for ARMCM3_EFM32/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x0B8)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static [blt_bool](#) [FlashEraseSectors](#) ([blt_int8u](#) first_sector, [blt_int8u](#) last_sector)
Erases the flash sectors from first_sector up until last_sector.
- static [blt_int8u](#) [FlashGetSector](#) ([blt_addr](#) address)
Determines the flash sector the address is in.
- static [blt_addr](#) [FlashGetSectorBaseAddr](#) ([blt_int8u](#) sector)
Determines the flash sector base address.
- static [blt_addr](#) [FlashGetSectorSize](#) ([blt_int8u](#) sector)
Determines the flash sector size.
- static [blt_int32u](#) [FlashCalcPageSize](#) (void)
Determines the flash page size for the specific EFM32 derivative. This is the minimum erase size.
- void [FlashInit](#) (void)
Initializes the flash driver.
- void [FlashReinit](#) (void)
Reinitializes the flash driver.

- `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase (blt_addr addr, blt_int32u len)`
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum (void)`
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum (void)`
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone (void)`
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress (void)`
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector flashLayout []`
If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`
Local variable with information about the flash boot block.

7.409.1 Detailed Description

Bootloader flash driver source file.

7.409.2 Function Documentation

7.409.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.409.2.2 FlashCalcPageSize()

```
static blt_int32u FlashCalcPageSize (  
    void ) [static]
```

Determines the flash page size for the specific EFM32 derivative. This is the minimum erase size.

Returns

The flash page size.

Referenced by FlashEraseSectors().

7.409.2.3 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.409.2.4 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.409.2.5 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector,  
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from first_sector up until last_sector.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.409.2.6 FlashGetSector()

```
static blt_int8u FlashGetSector (  
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.409.2.7 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (
    blt_int8u sector ) [static]
```

Determines the flash sector base address.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Flash sector base address or FLASH_INVALID_ADDRESS.

Referenced by FlashEraseSectors().

7.409.2.8 FlashGetSectorSize()

```
static blt_addr FlashGetSectorSize (
    blt_int8u sector ) [static]
```

Determines the flash sector size.

Parameters

<i>sector</i>	Sector to get the size of.
---------------	----------------------------

Returns

Flash sector size or 0.

Referenced by FlashEraseSectors().

7.409.2.9 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.409.2.10 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.409.2.11 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.409.2.12 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.409.2.13 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.409.2.14 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.409.2.15 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.409.2.16 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.409.2.17 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.409.3 Variable Documentation

7.409.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.409.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.409.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.

Array wit the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. The current flash layout does not reflect the minimum sector size of the physical flash (1 - 2kb), because this would make the table quit long and a waste of ROM. The minimum sector size is only really needed when erasing the flash. This can still be done in combination with macro FLASH_ERASE_BLOCK_SIZE.

7.410 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "inc/hw_memmap.h"
#include "inc/hw_types.h"
#include "driverlib/flashlib.h"

7.410.1 Detailed Description

Bootloader flash driver source file.

7.410.2 Function Documentation

7.410.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.410.2.2 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.410.2.3 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.410.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector,
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from `first_sector` up until `last_sector`.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.410.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.410.2.6 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (
    blt_int8u sector ) [static]
```

Determines the flash sector base address.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Flash sector base address or FLASH_INVALID_ADDRESS.

Referenced by FlashEraseSectors().

7.410.2.7 FlashGetSectorSize()

```
static blt_addr FlashGetSectorSize (  
    blt_int8u sector ) [static]
```

Determines the flash sector size.

Parameters

<i>sector</i>	Sector to get the size of.
---------------	----------------------------

Returns

Flash sector size or 0.

Referenced by FlashEraseSectors().

7.410.2.8 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.410.2.9 FlashInit()

```
void FlashInit (  
    void )
```

Initializes the flash driver.

Returns

none.

7.410.2.10 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.410.2.11 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.410.2.12 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.410.2.13 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.410.2.14 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.410.2.15 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.410.2.16 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.410.3 Variable Documentation

7.410.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.410.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.410.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. The current flash layout does not reflect the minimum sector size of the physical flash (1 - 2kb), because this would make the table quite long and a waste of ROM. The minimum sector size is only really needed when erasing the flash. This can still be done in combination with macro FLASH_ERASE_BLOCK_SIZE.

7.411 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "stm32f1xx.h"
Include dependency graph for ARMCM3_STM32F1/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SEGMENTS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of segments in array flashLayout[].
- #define [FLASH_LAST_SEGMENT_IDX](#) (FLASH_TOTAL_SEGMENTS-1)
Index of the last segment in array flashLayout[].
- #define [FLASH_START_ADDRESS](#) (flashLayout[0].sector_start)
Start address of the bootloader programmable flash.
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [FLASH_ERASE_BLOCK_SIZE](#) (FLASH_PAGE_SIZE)
Number of bytes to erase per erase operation.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x150)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- void [FlashInit](#) (void)
Initializes the flash driver.
- void [FlashReinit](#) (void)
Reinitializes the flash driver.
- [blt_bool](#) [FlashWrite](#) ([blt_addr](#) addr, [blt_int32u](#) len, [blt_int8u](#) *data)
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- [blt_bool](#) [FlashErase](#) ([blt_addr](#) addr, [blt_int32u](#) len)
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- [blt_bool](#) [FlashWriteChecksum](#) (void)

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

- [blt_bool FlashVerifyChecksum](#) (void)

Verifies the checksum, which indicates that a valid user program is present and can be started.

- [blt_bool FlashDone](#) (void)

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

- [blt_addr FlashGetUserProgBaseAddress](#) (void)

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const [tFlashSector flashLayout](#) []

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

- static [tFlashBlockInfo blockInfo](#)

Local variable with information about the flash block that is currently being operated on.

- static [tFlashBlockInfo bootBlockInfo](#)

Local variable with information about the flash boot block.

7.411.1 Detailed Description

Bootloader flash driver source file.

7.411.2 Function Documentation

7.411.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.411.2.2 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.411.2.3 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.411.2.4 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.411.2.5 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.411.2.6 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.411.2.7 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.411.2.8 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.411.2.9 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (  
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.411.2.10 FlashWrite()

```
blt_bool FlashWrite (  
    blt_addr addr,  
    blt_int32u len,  
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.411.2.11 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.411.2.12 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.411.3 Variable Documentation

7.411.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.411.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.411.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. The current flash layout does not reflect the minimum sector size of the physical flash (1 - 2kb), because this would make the table quite long and a waste of ROM. The minimum sector size is only really needed when erasing the flash. This can still be done in combination with macro `FLASH_ERASE_BLOCK_SIZE`.

7.412 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "stm32f2xx.h"
Include dependency graph for ARMCM3_STM32F2/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x184)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.

7.412.1 Detailed Description

Bootloader flash driver source file.

7.412.2 Function Documentation

7.412.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.412.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.412.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.412.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector,
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from first_sector up until last_sector.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.412.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), and FlashWrite().

7.412.2.6 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.412.2.7 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.412.2.8 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.412.2.9 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.412.2.10 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.412.2.11 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (  
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.412.2.12 FlashWrite()

```
blt_bool FlashWrite (  
    blt_addr addr,  
    blt_int32u len,  
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.412.2.13 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.412.2.14 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.412.3 Variable Documentation

7.412.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.412.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.412.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

Initial value:

```
=
{

    { 0x08008000, 0x04000, 2},
    { 0x0800c000, 0x04000, 3},
    { 0x08010000, 0x10000, 4},

    { 0x08020000, 0x20000, 5},

    { 0x08040000, 0x20000, 6},
    { 0x08060000, 0x20000, 7},

    { 0x08080000, 0x20000, 8},
    { 0x080A0000, 0x20000, 9},
    { 0x080C0000, 0x20000, 10},
    { 0x080E0000, 0x20000, 11},

}
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array wit the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.413 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "device_registers.h"
Include dependency graph for ARMCM4_S32K14/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR_IDX](#) (0xff)
Value for an invalid sector entry index into flashLayout[].
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (1024)
Standard size of a flash block for writing.
- #define [FLASH_ERASE_BLOCK_SIZE](#) (FEATURE_FLS_PF_BLOCK_SECTOR_SIZE)
Standard size of a flash block for erasing. This is either 2 or 4 kb depending on the microcontroller derivative.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [FLASH_FTFC_CMD_PROGRAM_PHRASE](#) (0x07U)
FTFC program phrase command code.
- #define [FLASH_FTFC_CMD_ERASE_SECTOR](#) (0x09U)
FTFC erase sector command code.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x3F8)
Offset into the user program's vector table where the checksum is located. For this target it is set to the second to last entry (254) in the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static [blt_bool](#) [FlashEraseSectors](#) ([blt_int8u](#) first_sector_idx, [blt_int8u](#) last_sector_idx)
Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.
- static [blt_int8u](#) [FlashGetSectorIdx](#) ([blt_addr](#) address)
Determines the index into the flashLayout[] array of the flash sector that the specified address is in.
- static [START_FUNCTION_DECLARATION_RAMSECTION](#) void [FlashCommandSequence](#) (void)
If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.
- void [FlashInit](#) (void)
Initializes the flash driver.
- void [FlashReinit](#) (void)
Reinitializes the flash driver.
- [blt_bool](#) [FlashWrite](#) ([blt_addr](#) addr, [blt_int32u](#) len, [blt_int8u](#) *data)
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- [blt_bool](#) [FlashErase](#) ([blt_addr](#) addr, [blt_int32u](#) len)
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- [blt_bool](#) [FlashWriteChecksum](#) (void)
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- [blt_bool](#) [FlashVerifyChecksum](#) (void)
Verifies the checksum, which indicates that a valid user program is present and can be started.
- [blt_bool](#) [FlashDone](#) (void)
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- [blt_addr](#) [FlashGetUserProgBaseAddress](#) (void)
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static [tFlashBlockInfo](#) [blockInfo](#)
Local variable with information about the flash block that is currently being operated on.
- static [tFlashBlockInfo](#) [bootBlockInfo](#)
Local variable with information about the flash boot block.

7.413.1 Detailed Description

Bootloader flash driver source file.

7.413.2 Function Documentation

7.413.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.413.2.2 FlashCommandSequence()

```
static START_FUNCTION_DEFINITION_RAMSECTION void FlashCommandSequence (
    void ) [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Use the FTFC module to run the flash command sequence. It is assumed that that command and its necessary parameters were already written to the correct FTFC registers.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

Attention

This function needs to run from RAM. It is configured such that the C start-up code automatically copies it from ROM to RAM in function `init_data_bss()`, which is called by the reset handler.

Returns

None.

Referenced by `FlashEraseSectors()`, `FlashGetSectorIdx()`, and `FlashWriteBlock()`.

7.413.2.3 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.413.2.4 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.413.2.5 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector_idx,
    blt_int8u last_sector_idx ) [static]
```

Erases the flash sectors from indices *first_sector_idx* up until *last_sector_idx* into the *flashLayout[]* array.

Parameters

<i>first_sector_idx</i>	First flash sector number index into <i>flashLayout[]</i> .
<i>last_sector_idx</i>	Last flash sector number index into <i>flashLayout[]</i> .

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.413.2.6 FlashGetSectorIdx()

```
static blt_int8u FlashGetSectorIdx (  
    blt_addr address ) [static]
```

Determines the index into the flashLayout[] array of the flash sector that the specified address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector index in flashLayout[] or FLASH_INVALID_SECTOR_IDX.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.413.2.7 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.413.2.8 FlashInit()

```
void FlashInit (  
    void )
```

Initializes the flash driver.

Returns

none.

7.413.2.9 FlashInitBlock()

```
static blt_bool FlashInitBlock (  
    tFlashBlockInfo * block,  
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.413.2.10 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.413.2.11 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is now being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.413.2.12 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.413.2.13 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.413.2.14 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.413.2.15 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.413.3 Variable Documentation

7.413.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.413.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. It is likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block needs to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way it is possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.414 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
```

```
#include "stm32f3xx.h"
```

Include dependency graph for ARMCM4_STM32F3/flash.c:

Data Structures

- struct [tFlashSector](#)

Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`
Local variable with information about the flash boot block.

7.414.1 Detailed Description

Bootloader flash driver source file.

7.414.2 Function Documentation

7.414.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.414.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.414.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.414.2.4 FlashGetUserProgBaseAddress()

```
bld_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.414.2.5 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.414.2.6 FlashInitBlock()

```
static bld_bool FlashInitBlock (
    tFlashBlockInfo * block,
    bld_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.414.2.7 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.414.2.8 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.414.2.9 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.414.2.10 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.414.2.11 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.414.2.12 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.414.3 Variable Documentation

7.414.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.414.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. It is likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block needs to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way it is possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.414.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.415 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"  
#include "stm32f4xx.h"
```

Include dependency graph for `ARMCM4_STM32F4/flash.c`:

Data Structures

- struct `tFlashSector`
Flash sector descriptor type.
- struct `tFlashBlockInfo`
Structure type for grouping flash block information.

Macros

- `#define FLASH_INVALID_SECTOR (0xff)`
Value for an invalid flash sector.
- `#define FLASH_INVALID_ADDRESS (0xffffffff)`
Value for an invalid flash address.
- `#define FLASH_WRITE_BLOCK_SIZE (512)`
Standard size of a flash block for writing.
- `#define FLASH_TOTAL_SECTORS (sizeof(flashLayout)/sizeof(flashLayout[0]))`
Total numbers of sectors in array flashLayout[].
- `#define FLASH_END_ADDRESS`
End address of the bootloader programmable flash.
- `#define BOOT_FLASH_VECTOR_TABLE_CS_OFFSET (0x188)`
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- `static blt_bool FlashInitBlock (tFlashBlockInfo *block, blt_addr address)`
Copies data currently in flash to the block->data and sets the base address.
- `static tFlashBlockInfo * FlashSwitchBlock (tFlashBlockInfo *block, blt_addr base_addr)`
Switches blocks by programming the current one and initializing the next.
- `static blt_bool FlashAddToBlock (tFlashBlockInfo *block, blt_addr address, blt_int8u *data, blt_int32u len)`
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- `static blt_bool FlashWriteBlock (tFlashBlockInfo *block)`
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- `static blt_bool FlashEraseSectors (blt_int8u first_sector, blt_int8u last_sector)`
Erases the flash sectors from first_sector up until last_sector.
- `static blt_int8u FlashGetSector (blt_addr address)`
Determines the flash sector the address is in.
- `void FlashInit (void)`
Initializes the flash driver.
- `void FlashReinit (void)`
Reinitializes the flash driver.
- `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase (blt_addr addr, blt_int32u len)`
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum (void)`
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum (void)`
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone (void)`
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress (void)`
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const [tFlashSector flashLayout \[\]](#)

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

- static [tFlashBlockInfo blockInfo](#)

Local variable with information about the flash block that is currently being operated on.

- static [tFlashBlockInfo bootBlockInfo](#)

Local variable with information about the flash boot block.

7.415.1 Detailed Description

Bootloader flash driver source file.

7.415.2 Function Documentation

7.415.2.1 FlashAddToBlock()

```
static blt\_bool FlashAddToBlock (  
    tFlashBlockInfo * block,  
    blt\_addr address,  
    blt\_int8u * data,  
    blt\_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by `FlashWrite()`.

7.415.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.415.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.415.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector,
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from *first_sector* up until *last_sector*.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.415.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), and FlashWrite().

7.415.2.6 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.415.2.7 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.415.2.8 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.415.2.9 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.415.2.10 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.415.2.11 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.415.2.12 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.415.2.13 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.415.2.14 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.415.3 Variable Documentation

7.415.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.415.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. It is likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block needs to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way it is possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.415.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.416 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include "stm32l4xx.h"
Include dependency graph for ARMC4_STM32L4/flash.c:
```

Data Structures

- struct `tFlashSector`
Flash sector descriptor type.
- struct `tFlashBlockInfo`
Structure type for grouping flash block information.

Macros

- `#define FLASH_INVALID_ADDRESS (0xffffffff)`
Value for an invalid flash address.
- `#define FLASH_WRITE_BLOCK_SIZE (512)`
Standard size of a flash block for writing.
- `#define FLASH_ERASE_SECTOR_SIZE (2048)`
Standard size of a flash sector for erasing.
- `#define FLASH_TOTAL_SEGMENTS (sizeof(flashLayout)/sizeof(flashLayout[0]))`
Total numbers of segments in array flashLayout[].
- `#define FLASH_LAST_SEGMENT_IDX (FLASH_TOTAL_SEGMENTS-1)`
Index of the last segment in array flashLayout[].
- `#define FLASH_START_ADDRESS (flashLayout[0].sector_start)`
Start address of the bootloader programmable flash.
- `#define FLASH_END_ADDRESS`
End address of the bootloader programmable flash.
- `#define BOOT_FLASH_VECTOR_TABLE_CS_OFFSET (0x188)`
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static `blt_bool FlashInitBlock (tFlashBlockInfo *block, blt_addr address)`
Copies data currently in flash to the block->data and sets the base address.
- static `tFlashBlockInfo * FlashSwitchBlock (tFlashBlockInfo *block, blt_addr base_addr)`
Switches blocks by programming the current one and initializing the next.
- static `blt_bool FlashAddToBlock (tFlashBlockInfo *block, blt_addr address, blt_int8u *data, blt_int32u len)`
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static `blt_bool FlashWriteBlock (tFlashBlockInfo *block)`
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static `blt_int32u FlashGetPage (blt_addr address)`
Gets the page number of the address relative to the bank.
- static `blt_int32u FlashGetBank (blt_addr address)`
Obtains the bank of the given address. The 1024kb version of the flash device contains 2 banks that can be swapped. This feature breaks the link between a bank number and flash addresses. This function obtains the bank number that is currently at the given address.
- void `FlashInit (void)`
Initializes the flash driver.
- void `FlashReinit (void)`
Reinitializes the flash driver.
- `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase (blt_addr addr, blt_int32u len)`
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased. Note that the term sector used by this flash driver is equivalent to the term page in the STM32L4x reference manual.
- `blt_bool FlashWriteChecksum (void)`

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

- [blt_bool FlashVerifyChecksum](#) (void)

Verifies the checksum, which indicates that a valid user program is present and can be started.

- [blt_bool FlashDone](#) (void)

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

- [blt_addr FlashGetUserProgBaseAddress](#) (void)

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const [tFlashSector flashLayout](#) []

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

- static [tFlashBlockInfo blockInfo](#)

Local variable with information about the flash block that is currently being operated on.

Local variable with information about the flash boot block.

7.416.1 Detailed Description

Bootloader flash driver source file.

7.416.2 Function Documentation

7.416.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.416.2.2 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.416.2.3 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased. Note that the term sector used by this flash driver is equivalent to the term page in the STM32L4x reference manual.

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.416.2.4 FlashGetBank()

```
static blt_int32u FlashGetBank (  
    blt_addr address ) [static]
```

Obtains the bank of the given address. The 1024kb version of the flash device contains 2 banks that can be swapped. This feature breaks the link between a bank number and flash addresses. This function obtains the bank number that is currently at the given address.

Parameters

<i>address</i>	Address in the flash bank.
----------------	----------------------------

Returns

The flash bank of the given address: FLASH_BANK_1 or FLASH_BANK_2.

Referenced by FlashErase().

7.416.2.5 FlashGetPage()

```
static blt_int32u FlashGetPage (
    blt_addr address ) [static]
```

Gets the page number of the address relative to the bank.

Parameters

<i>address</i>	Address in the flash bank.
----------------	----------------------------

Returns

The page of the given address: 0..255.

Referenced by FlashErase().

7.416.2.6 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.416.2.7 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.416.2.8 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.416.2.9 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.416.2.10 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.416.2.11 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.416.2.12 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.416.2.13 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.416.2.14 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.416.3 Variable Documentation

7.416.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.416.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.416.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory. Note that the current flash driver supports the STM32L4x1, STM32L4x5 and STM32L4x6 derivatives in the STM32L4 family of microcontrollers.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.417 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
#include <stdbool.h>
#include <stdint.h>
#include "inc/hw_memmap.h"
#include "inc/hw_types.h"
#include "driverlib/flashlib.h"
```

Include dependency graph for ARMCM4_TM4C/flash.c:

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (1024)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [FLASH_ERASE_BLOCK_SIZE](#) (0x400)
Number of bytes to erase per erase operation.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x26C)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static [blt_bool](#) [FlashEraseSectors](#) ([blt_int8u](#) first_sector, [blt_int8u](#) last_sector)
Erases the flash sectors from first_sector up until last_sector.
- static [blt_int8u](#) [FlashGetSector](#) ([blt_addr](#) address)
Determines the flash sector the address is in.
- static [blt_addr](#) [FlashGetSectorBaseAddr](#) ([blt_int8u](#) sector)
Determines the flash sector base address.
- static [blt_addr](#) [FlashGetSectorSize](#) ([blt_int8u](#) sector)
Determines the flash sector size.
- void [FlashInit](#) (void)
Initializes the flash driver.
- void [FlashReinit](#) (void)
Reinitializes the flash driver.

- `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase (blt_addr addr, blt_int32u len)`
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum (void)`
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum (void)`
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone (void)`
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress (void)`
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector flashLayout []`
If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`
Local variable with information about the flash boot block.

7.417.1 Detailed Description

Bootloader flash driver source file.

7.417.2 Function Documentation

7.417.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.417.2.2 FlashDone()

```
blt_bool FlashDone (  
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.417.2.3 FlashErase()

```
blt_bool FlashErase (  
    blt_addr addr,  
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.417.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector,  
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from first_sector up until last_sector.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.417.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (  
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.417.2.6 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (  
    blt_int8u sector ) [static]
```

Determines the flash sector base address.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Flash sector base address or FLASH_INVALID_ADDRESS.

Referenced by FlashEraseSectors().

7.417.2.7 FlashGetSectorSize()

```
static blt_addr FlashGetSectorSize (  
    blt_int8u sector ) [static]
```

Determines the flash sector size.

Parameters

<i>sector</i>	Sector to get the size of.
---------------	----------------------------

Returns

Flash sector size or 0.

Referenced by FlashEraseSectors().

7.417.2.8 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (  
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.417.2.9 FlashInit()

```
void FlashInit (  
    void )
```

Initializes the flash driver.

Returns

none.

7.417.2.10 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.417.2.11 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.417.2.12 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.417.2.13 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (  
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.417.2.14 FlashWrite()

```
blt_bool FlashWrite (  
    blt_addr addr,  
    blt_int32u len,  
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.417.2.15 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (  
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.417.2.16 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.417.3 Variable Documentation**7.417.3.1 blockInfo**

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.417.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.417.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. The current flash layout does not reflect the minimum sector size of the physical flash (1 - 2kb), because this would make the table quite long and a waste of ROM. The minimum sector size is only really needed when erasing the flash. This can still be done in combination with macro `FLASH_ERASE_BLOCK_SIZE`.

7.418 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
```

```
#include "xmc_flash.h"
```

Include dependency graph for ARMCM4_XMC4/flash.c:

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (1024)
Standard size of a flash block for writing. It should be large enough so that the OpenBLT checksum fits in the first (boot) block)
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x200)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.
- #define [FLASH_WRITE_PAGE_SIZE](#) (256)
Minimum amount of bytes that can be programmed to flash at a time. It is hardware dependent.
- #define [FLASH_UNCACHED_BASE_ADDR](#) (0x0C000000U)
Base address in the memory map for uncached flash. It is hardware dependent.
- #define [FLASH_CACHED_BASE_ADDR](#) (0x08000000U)
Base address in the memory map for cached flash. It is hardware dependent.
- #define [FLASH_ERASE_TIME_MAX_MS](#) (6600)
Maximum time for a sector erase operation as specified by the XCM4xxx data- sheet with an added 20% margin.
- #define [FLASH_PROGRAM_TIME_MAX_MS](#) (13)
Maximum time for a page program operation as specified by the XCM4xxx data- sheet with an added 20% margin.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)
Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)
Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static [blt_bool](#) [FlashEraseSectors](#) ([blt_int8u](#) first_sector, [blt_int8u](#) last_sector)
Erases the flash sectors from first_sector up until last_sector.
- static [blt_int8u](#) [FlashGetSector](#) ([blt_addr](#) address)

- Determines the flash sector the address is in.*

 - static `blt_addr FlashGetSectorBaseAddr (blt_int8u sector)`

Obtains the base address of the specified sector.
 - static `blt_addr FlashTranslateToNonCachedAddress (blt_addr address)`

The XMC4xxx has its PFLASH accessible in the memory map in two regions. One is the non-cached region starting at FLASH_UNCACHED_BASE_ADDR and the other is the cached region starting at FLASH_CACHED_BASE_ADDR. Flash erase and programming operations need to operate on addresses in the non-cached region. It is possible that the caller of this driver's API functions, specifies memory addresses in the cached region. This function automatically translates the memory address from cached to non-cached.
 - void `FlashInit (void)`

Initializes the flash driver.
 - void `FlashReinit (void)`

Reinitializes the flash driver.
 - `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
 - `blt_bool FlashErase (blt_addr addr, blt_int32u len)`

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
 - `blt_bool FlashWriteChecksum (void)`

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
 - `blt_bool FlashVerifyChecksum (void)`

Verifies the checksum, which indicates that a valid user program is present and can be started.
 - `blt_bool FlashDone (void)`

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
 - `blt_addr FlashGetUserProgBaseAddress (void)`

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector flashLayout []`

If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo blockInfo`

Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`

Local variable with information about the flash boot block.

7.418.1 Detailed Description

Bootloader flash driver source file.

7.418.2 Function Documentation

7.418.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.418.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.418.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.418.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector,  
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from first_sector up until last_sector.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.418.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (  
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.418.2.6 FlashGetSectorBaseAddr()

```
static blt_addr FlashGetSectorBaseAddr (
    blt_int8u sector ) [static]
```

Obtains the base address of the specified sector.

Parameters

<i>sector</i>	Sector to get the base address of.
---------------	------------------------------------

Returns

Base Base address of the sector if found, FLASH_INVALID_ADDRESS otherwise.

Referenced by FlashEraseSectors().

7.418.2.7 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.418.2.8 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.418.2.9 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.418.2.10 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.418.2.11 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.418.2.12 FlashTranslateToNonCachedAddress()

```
static blt_addr FlashTranslateToNonCachedAddress (
    blt_addr address ) [static]
```

The XMC4xxx has its PFLASH accessible in the memory map in two regions. One is the non-cached region starting at FLASH_UNCACHED_BASE_ADDR and the other is the cached region starting at FLASH_CACHED_BASE_ADDR. Flash erase and programming operations need to operate on addresses in the non-cached region. It is possible that the caller of this driver's API functions, specifies memory addresses in the cached region. This function automatically translates the memory address from cached to non-cached.

Parameters

<i>address</i>	Address to translate.
----------------	-----------------------

Returns

Translated address.

Referenced by FlashErase(), and FlashWrite().

7.418.2.13 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.418.2.14 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.418.2.15 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (  
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.418.2.16 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.418.3 Variable Documentation

7.418.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.418.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.418.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

Initial value:

```
=
{
    { 0x0c00c000, 0x04000, 3},
    { 0x0c010000, 0x04000, 4},
    { 0x0c014000, 0x04000, 5},
    { 0x0c018000, 0x04000, 6},
    { 0x0c01c000, 0x04000, 7},
    { 0x0c020000, 0x20000, 8},

    { 0x0c040000, 0x40000, 9},

    { 0x0c080000, 0x40000, 10},
```

```
{ 0x0c0C0000, 0x40000, 11},  
  
}
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten. Note that the table contains uncached addresses, because flash program/ erase operations need to be performed on uncached addresses. This flash driver automatically translated cached to uncached addresses, so there is no need for the user to adjust this when calling this driver's API.

7.419 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"  
#include "stm32f7xx.h"  
Include dependency graph for ARMC7_STM32F7/flash.c:
```

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- `#define FLASH_INVALID_SECTOR (0xff)`
Value for an invalid flash sector.
- `#define FLASH_INVALID_ADDRESS (0xffffffff)`
Value for an invalid flash address.
- `#define FLASH_WRITE_BLOCK_SIZE (512)`
Standard size of a flash block for writing.
- `#define FLASH_TOTAL_SECTORS (sizeof(flashLayout)/sizeof(flashLayout[0]))`
Total numbers of sectors in array flashLayout[].
- `#define FLASH_END_ADDRESS`
End address of the bootloader programmable flash.
- `#define BOOT_FLASH_VECTOR_TABLE_CS_OFFSET (0x1C8)`
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- `static blt_bool FlashInitBlock (tFlashBlockInfo *block, blt_addr address)`
Copies data currently in flash to the block->data and sets the base address.
- `static tFlashBlockInfo * FlashSwitchBlock (tFlashBlockInfo *block, blt_addr base_addr)`
Switches blocks by programming the current one and initializing the next.
- `static blt_bool FlashAddToBlock (tFlashBlockInfo *block, blt_addr address, blt_int8u *data, blt_int32u len)`
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- `static blt_bool FlashWriteBlock (tFlashBlockInfo *block)`
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- `static blt_bool FlashEraseSectors (blt_int8u first_sector, blt_int8u last_sector)`
Erases the flash sectors from first_sector up until last_sector.
- `static blt_int8u FlashGetSector (blt_addr address)`
Determines the flash sector the address is in.
- `static blt_bool FlashIsSingleBankMode (void)`
Determines the flash is configured in single bank mode, which is required by this flash driver.
- `void FlashInit (void)`
Initializes the flash driver.
- `void FlashReinit (void)`
Reinitializes the flash driver.
- `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool FlashErase (blt_addr addr, blt_int32u len)`
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool FlashWriteChecksum (void)`
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool FlashVerifyChecksum (void)`
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool FlashDone (void)`
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr FlashGetUserProgBaseAddress (void)`
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const [tFlashSector flashLayout \[\]](#)

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

- static [tFlashBlockInfo blockInfo](#)

Local variable with information about the flash block that is currently being operated on.

- static [tFlashBlockInfo bootBlockInfo](#)

Local variable with information about the flash boot block.

7.419.1 Detailed Description

Bootloader flash driver source file.

7.419.2 Function Documentation

7.419.2.1 FlashAddToBlock()

```
static blt\_bool FlashAddToBlock (  
    tFlashBlockInfo * block,  
    blt\_addr address,  
    blt\_int8u * data,  
    blt\_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by `FlashWrite()`.

7.419.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.419.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.419.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (
    blt_int8u first_sector,
    blt_int8u last_sector ) [static]
```

Erases the flash sectors from *first_sector* up until *last_sector*.

Parameters

<i>first_sector</i>	First flash sector number.
<i>last_sector</i>	Last flash sector number.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.419.2.5 FlashGetSector()

```
static blt_int8u FlashGetSector (
    blt_addr address ) [static]
```

Determines the flash sector the address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector number or FLASH_INVALID_SECTOR.

Referenced by FlashErase(), and FlashWrite().

7.419.2.6 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.419.2.7 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.419.2.8 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.419.2.9 FlashIsSingleBankMode()

```
static blt_bool FlashIsSingleBankMode (  
    void ) [static]
```

Determines the flash is configured in single bank mode, which is required by this flash driver.

Returns

BLT_TRUE if the flash is in single bank mode, BLT_FALSE otherwise.

Referenced by FlashEraseSectors(), and FlashWriteBlock().

7.419.2.10 FlashReinit()

```
void FlashReinit (  
    void )
```

Reinitializes the flash driver.

Returns

none.

7.419.2.11 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (  
    tFlashBlockInfo * block,  
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is no being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.419.2.12 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.419.2.13 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.419.2.14 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.419.2.15 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.419.3 Variable Documentation

7.419.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.419.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.419.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

Initial value:

```
=
{
    { 0x08008000, 0x08000, 1},
    { 0x08010000, 0x08000, 2},
    { 0x08018000, 0x08000, 3},

    { 0x08020000, 0x20000, 4},

    { 0x08040000, 0x40000, 5},

    { 0x08080000, 0x40000, 6},
    { 0x080C0000, 0x40000, 7},

}
```

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.

Array wit the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.420 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
```

```
#include "stm32h7xx.h"
```

Include dependency graph for ARMCM7_STM32H7/flash.c:

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.

Macros

- #define [FLASH_INVALID_SECTOR_IDX](#) (0xff)
Value for an invalid sector entry index into flashLayout[].
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (1024)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [FLASH_END_ADDRESS](#)
End address of the bootloader programmable flash.
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x298)
Offset into the user program's vector table where the checksum is located. For this target it is set to the end of the vector table. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.

Functions

- static `blt_bool` `FlashInitBlock` (`tFlashBlockInfo` *block, `blt_addr` address)
Copies data currently in flash to the block->data and sets the base address.
- static `tFlashBlockInfo` * `FlashSwitchBlock` (`tFlashBlockInfo` *block, `blt_addr` base_addr)
Switches blocks by programming the current one and initializing the next.
- static `blt_bool` `FlashAddToBlock` (`tFlashBlockInfo` *block, `blt_addr` address, `blt_int8u` *data, `blt_int32u` len)
Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static `blt_bool` `FlashWriteBlock` (`tFlashBlockInfo` *block)
Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static `blt_bool` `FlashEraseSectors` (`blt_int8u` first_sector_idx, `blt_int8u` last_sector_idx)
Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.
- static `blt_int8u` `FlashGetSectorIdx` (`blt_addr` address)
Determines the index into the flashLayout[] array of the flash sector that the specified address is in.
- void `FlashInit` (void)
Initializes the flash driver.
- void `FlashReinit` (void)
Reinitializes the flash driver.
- `blt_bool` `FlashWrite` (`blt_addr` addr, `blt_int32u` len, `blt_int8u` *data)
Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
- `blt_bool` `FlashErase` (`blt_addr` addr, `blt_int32u` len)
Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
- `blt_bool` `FlashWriteChecksum` (void)
Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
- `blt_bool` `FlashVerifyChecksum` (void)
Verifies the checksum, which indicates that a valid user program is present and can be started.
- `blt_bool` `FlashDone` (void)
Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
- `blt_addr` `FlashGetUserProgBaseAddress` (void)
Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Variables

- static const `tFlashSector` `flashLayout` []
If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.
- static `tFlashBlockInfo` `blockInfo`
Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo` `bootBlockInfo`
Local variable with information about the flash boot block.

7.420.1 Detailed Description

Bootloader flash driver source file.

7.420.2 Function Documentation

7.420.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWrite().

7.420.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.420.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.420.2.4 FlashEraseSectors()

```
static blt_bool FlashEraseSectors (  
    blt_int8u first_sector_idx,  
    blt_int8u last_sector_idx ) [static]
```

Erases the flash sectors from indices first_sector_idx up until last_sector_idx into the flashLayout[] array.

Parameters

<i>first_sector_idx</i>	First flash sector number index into flashLayout[].
<i>last_sector_idx</i>	Last flash sector number index into flashLayout[].

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashErase().

7.420.2.5 FlashGetSectorIdx()

```
static blt_int8u FlashGetSectorIdx (  
    blt_addr address ) [static]
```

Determines the index into the flashLayout[] array of the flash sector that the specified address is in.

Parameters

<i>address</i>	Address in the flash sector.
----------------	------------------------------

Returns

Flash sector index in flashLayout[] or FLASH_INVALID_SECTOR_IDX.

Referenced by FlashErase(), FlashWrite(), and FlashWriteBlock().

7.420.2.6 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.420.2.7 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.420.2.8 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```

Copies data currently in flash to the block->data and sets the base address.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Base address of the block data.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashAddToBlock(), and FlashSwitchBlock().

7.420.2.9 FlashReinit()

```
void FlashReinit (
    void )
```

Reinitializes the flash driver.

Returns

none.

7.420.2.10 FlashSwitchBlock()

```
static tFlashBlockInfo * FlashSwitchBlock (
    tFlashBlockInfo * block,
    blt_addr base_addr ) [static]
```

Switches blocks by programming the current one and initializing the next.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>base_addr</i>	Base address of the next block.

Returns

The pointer of the block info struct that is now being used, or a NULL pointer in case of error.

Referenced by FlashAddToBlock().

7.420.2.11 FlashVerifyChecksum()

```
blt_bool FlashVerifyChecksum (
    void )
```

Verifies the checksum, which indicates that a valid user program is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.420.2.12 FlashWrite()

```
blt_bool FlashWrite (
    blt_addr addr,
    blt_int32u len,
    blt_int8u * data )
```

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.
<i>data</i>	Pointer to the data buffer.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashWriteChecksum().

7.420.2.13 FlashWriteBlock()

```
static blt_bool FlashWriteBlock (  
    tFlashBlockInfo * block ) [static]
```

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
--------------	--

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

Referenced by FlashDone(), and FlashSwitchBlock().

7.420.2.14 FlashWriteChecksum()

```
blt_bool FlashWriteChecksum (  
    void )
```

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.420.3 Variable Documentation

7.420.3.1 blockInfo

```
tFlashBlockInfo blockInfo [static]
```

Local variable with information about the flash block that is currently being operated on.

The smallest amount of flash that can be programmed is FLASH_WRITE_BLOCK_SIZE. A flash block manager is implemented in this driver and stores info in this variable. Whenever new data should be flashed, it is first added to a RAM buffer, which is part of this variable. Whenever the RAM buffer, which has the size of a flash block, is full or data needs to be written to a different block, the contents of the RAM buffer are programmed to flash. The flash block manager requires some software overhead, yet results in faster flash programming because data is first harvested, ideally until there is enough to program an entire flash block, before the flash device is actually operated on.

Referenced by FlashSwitchBlock().

7.420.3.2 bootBlockInfo

```
tFlashBlockInfo bootBlockInfo [static]
```

Local variable with information about the flash boot block.

The first block of the user program holds the vector table, which on the STM32 is also the where the checksum is written to. Is it likely that the vector table is first flashed and then, at the end of the programming sequence, the checksum. This means that this flash block need to be written to twice. Normally this is not a problem with flash memory, as long as you write the same values to those bytes that are not supposed to be changed and the locations where you do write to are still in the erased 0xFF state. Unfortunately, writing twice to flash this way, does not work reliably on all micros. This is why we need to have an extra block, the bootblock, placed under the management of the block manager. This way is it possible to implement functionality so that the bootblock is only written to once at the end of the programming sequence.

Referenced by FlashSwitchBlock().

7.420.3.3 flashLayout

```
const tFlashSector flashLayout[] [static]
```

If desired, it is possible to set BOOT_FLASH_CUSTOM_LAYOUT_ENABLE to > 0 in blt_conf.h and then implement your own version of the flashLayout[] table in a source-file with the name flash_layout.c. This way you customize the flash memory size reserved for the bootloader, without having to modify the flashLayout[] table in this file directly. This file will then include flash_layout.c so there is no need to compile it additionally with your project.

Array with the layout of the flash memory.

Also controls what part of the flash memory is reserved for the bootloader. If the bootloader size changes, the reserved sectors for the bootloader might need adjustment to make sure the bootloader doesn't get overwritten.

7.421 flash.c File Reference

Bootloader flash driver source file.

```
#include "boot.h"
```

Include dependency graph for HCS12/flash.c:

Data Structures

- struct [tFlashSector](#)
Flash sector descriptor type.
- struct [tFlashBlockInfo](#)
Structure type for grouping flash block information.
- struct [tFlashRegs](#)
Structure type for the flash control registers.

Macros

- #define [FLASH_INVALID_SECTOR_IDX](#) (0xff)
Value for an invalid flash sector.
- #define [FLASH_INVALID_ADDRESS](#) (0xffffffff)
Value for an invalid flash address.
- #define [FLASH_WRITE_BLOCK_SIZE](#) (512)
Standard size of a flash block for writing.
- #define [FLASH_TOTAL_SECTORS](#) (sizeof(flashLayout)/sizeof(flashLayout[0]))
Total numbers of sectors in array flashLayout[].
- #define [BOOT_FLASH_VECTOR_TABLE_CS_OFFSET](#) (0x82)
Offset into the user program's vector table where the checksum is located. Note that the value can be overridden in blt_conf.h, because the size of the vector table could vary. When changing this value, don't forget to update the location of the checksum in the user program accordingly. Otherwise the checksum verification will always fail.
- #define [FLASH_VECTOR_TABLE_SIZE](#) (0x80)
Total size of the vector table, excluding the bootloader specific checksum.

FCNFG - command buf. empty irq enable bit.
- #define [CCIE_BIT](#) (0x40)

FCNFG - command complete irq enable bit.
- #define [KEYACC_BIT](#) (0x20)

FCNFG - enable security key writing bit.

Typedefs

- typedef void(* [pFlashExeCmdFct](#)) (void)

Pointer type to flash command execution function.

Functions

- static [blt_bool](#) [FlashInitBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address)

Copies data currently in flash to the block->data and sets the base address.
- static [tFlashBlockInfo](#) * [FlashSwitchBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) base_addr)

Switches blocks by programming the current one and initializing the next.
- static [blt_bool](#) [FlashAddToBlock](#) ([tFlashBlockInfo](#) *block, [blt_addr](#) address, [blt_int8u](#) *data, [blt_int32u](#) len)

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.
- static [blt_bool](#) [FlashWriteBlock](#) ([tFlashBlockInfo](#) *block)

Programs FLASH_WRITE_BLOCK_SIZE bytes to flash from the block->data array.
- static [blt_int8u](#) [FlashGetLinearAddrByte](#) ([blt_addr](#) addr)

- Reads the byte value from the linear address.*

 - static `blt_int8u FlashGetPhysPage (blt_addr addr)`

Extracts the physical flash page number from a linear address.
 - static `blt_int16u FlashGetPhysAddr (blt_addr addr)`

Extracts the physical address on the flash page number from a linear address.
 - static void `FlashExecuteCommand (void)`

Executes the command. The actual code for the command execution is stored as location independant machine code in array `flashExecCmd[]`. The contents of this array are temporarily copied to RAM. This way the function can be executed from RAM avoiding problem when try to perform a flash operation on the same flash block that this driver is located.
 - static `blt_bool FlashOperate (blt_int8u cmd, blt_addr addr, blt_int16u data)`

Prepares the flash command and executes it.
 - void `FlashInit (void)`

Initializes the flash driver.
 - void `FlashReinit (void)`

Reinitializes the flash driver.
 - `blt_bool FlashWrite (blt_addr addr, blt_int32u len, blt_int8u *data)`

Writes the data to flash through a flash block manager. Note that this function also checks that no data is programmed outside the flash memory region, so the bootloader can never be overwritten.
 - `blt_bool FlashErase (blt_addr addr, blt_int32u len)`

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.
 - `blt_bool FlashWriteChecksum (void)`

Writes a checksum of the user program to non-volatile memory. This is performed once the entire user program has been programmed. Through the checksum, the bootloader can check if the programming session was completed, which indicates that a valid user programming is present and can be started.
 - `blt_bool FlashVerifyChecksum (void)`

Verifies the checksum, which indicates that a valid user program is present and can be started.
 - `blt_bool FlashDone (void)`

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.
 - `blt_addr FlashGetUserProgBaseAddress (void)`

Obtains the base address of the flash memory available to the user program. This is basically the last address in the `flashLayout` table converted to the physical address on the last page (0x3f), because this is where the address will be in.

Variables

- static const `tFlashSector flashLayout []`

If desired, it is possible to set `BOOT_FLASH_CUSTOM_LAYOUT_ENABLE` to `> 0` in `blt_conf.h` and then implement your own version of the `flashLayout[]` table in a source-file with the name `flash_layout.c`. This way you customize the flash memory size reserved for the bootloader, without having to modify the `flashLayout[]` table in this file directly. This file will then include `flash_layout.c` so there is no need to compile it additionally with your project.
- static const `blt_int8u flashExecCmd []`

Array with executable code for performing flash operations.
- static `tFlashBlockInfo blockInfo`

Local variable with information about the flash block that is currently being operated on.
- static `tFlashBlockInfo bootBlockInfo`

Local variable with information about the flash boot block.
- static `blt_int8u flashExecCmdRam [(sizeof(flashExecCmd)/sizeof(flashExecCmd[0]))]`

RAM buffer where the executable flash operation code is copied to.
- static `blt_int8u flashMaxNrBlocks`

Maximum number of supported blocks, which is determined dynamically to have code that is independent of the used HCS12 derivative.

7.421.1 Detailed Description

Bootloader flash driver source file.

7.421.2 Function Documentation

7.421.2.1 FlashAddToBlock()

```
static blt_bool FlashAddToBlock (
    tFlashBlockInfo * block,
    blt_addr address,
    blt_int8u * data,
    blt_int32u len ) [static]
```

Programming is done per block. This function adds data to the block that is currently collecting data to be written to flash. If the address is outside of the current block, the current block is written to flash and a new block is initialized.

Parameters

<i>block</i>	Pointer to flash block info structure to operate on.
<i>address</i>	Flash destination address.
<i>data</i>	Pointer to the byte array with data.
<i>len</i>	Number of bytes to add to the block.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.421.2.2 FlashDone()

```
blt_bool FlashDone (
    void )
```

Finalizes the flash driver operations. There could still be data in the currently active block that needs to be flashed.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.421.2.3 FlashErase()

```
blt_bool FlashErase (
    blt_addr addr,
    blt_int32u len )
```

Erases the flash memory. Note that this function also checks that no data is erased outside the flash memory region, so the bootloader can never be erased.

Parameters

<i>addr</i>	Start address.
<i>len</i>	Length in bytes.

Returns

BLT_TRUE if successful, BLT_FALSE otherwise.

7.421.2.4 FlashExecuteCommand()

```
static void FlashExecuteCommand (  
    void ) [static]
```

Executes the command. The actual code for the command execution is stored as location independant machine code in array flashExecCmd[]. The contents of this array are temporarily copied to RAM. This way the function can be executed from RAM avoiding problem when try to perform a flash operation on the same flash block that this driver is located.

Returns

none.

Referenced by FlashOperate().

7.421.2.5 FlashGetLinearAddrByte()

```
static blt_int8u FlashGetLinearAddrByte (  
    blt_addr addr ) [static]
```

Reads the byte value from the linear address.

Parameters

<i>addr</i>	Linear address.
-------------	-----------------

Returns

The byte value located at the linear address.

Referenced by FlashWriteBlock().

7.421.2.6 FlashGetPhysAddr()

```
static blt_int16u FlashGetPhysAddr (
    blt_addr addr ) [static]
```

Extracts the physical address on the flash page number from a linear address.

Parameters

<i>addr</i>	Linear address.
-------------	-----------------

Returns

The physical address.

Referenced by FlashGetLinearAddrByte(), FlashGetUserProgBaseAddress(), FlashInitBlock(), and FlashOperate().

7.421.2.7 FlashGetPhysPage()

```
static blt_int8u FlashGetPhysPage (
    blt_addr addr ) [static]
```

Extracts the physical flash page number from a linear address.

Parameters

<i>addr</i>	Linear address.
-------------	-----------------

Returns

The page number.

Referenced by FlashGetLinearAddrByte(), FlashInitBlock(), and FlashOperate().

7.421.2.8 FlashGetUserProgBaseAddress()

```
blt_addr FlashGetUserProgBaseAddress (
    void )
```

Obtains the base address of the flash memory available to the user program. This is basically the last address in the flashLayout table converted to the physical address on the last page (0x3f), because this is where the address will be in.

Obtains the base address of the flash memory available to the user program. This is basically the first address in the flashLayout table.

Returns

Base address.

7.421.2.9 FlashInit()

```
void FlashInit (
    void )
```

Initializes the flash driver.

Returns

none.

7.421.2.10 FlashInitBlock()

```
static blt_bool FlashInitBlock (
    tFlashBlockInfo * block,
    blt_addr address ) [static]
```
