Note that the previous example is for an STM32F0 microcontroller where the first 192 (0xC0) bytes in RAM are reserved for the user program vector table.

#### Remarks

This same approach can be applied with other toolchains such as Keil MDK and IAR EWARM. Consult the compiler and linker user manuals of your toolchain to find out how to place a RAM variable at a fixed memory address and to prevent the C-startup code from zeroing its contents. Here are a few links to get you started:

- IAR EWARM: <https://www.iar.com/support/tech-notes/compiler/linker-error-for-absolute-located-variable/>
- Keil MDK: <http://www.keil.com/support/docs/3480.htm>

### 7.1166.2.2 SharedParamsCalculateChecksum()

```
static uint16_t SharedParamsCalculateChecksum (
 void) [static]
```

Calculates and returns the checksum value for the current contents in the buffer. The checksum is calculated by taking the sum of all bytes in the parameter buffer (excluding the checksum at the end) and then taking the two's complement value of it.

#### Returns

The calculated checksum value.

Referenced by SharedParamsVerifyChecksum(), and SharedParamsWriteChecksum().

### 7.1166.2.3 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

### 7.1166.2.4 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

#### Returns

True if successful, false otherwise.

#### 7.1166.2.5 SharedParamsValidateBuffer()

```
static bool SharedParamsValidateBuffer (
 void) [static]
```

Validates the shared parameter buffer contents by looking at the table identifier and verifying its checksum.

##### Returns

True if successful, false otherwise.

Referenced by SharedParamsInit(), SharedParamsReadByIndex(), and SharedParamsWriteByIndex().

#### 7.1166.2.6 SharedParamsVerifyChecksum()

```
static bool SharedParamsVerifyChecksum (
 void) [static]
```

Calculates and verifies the checksum that is currently present in the buffer.

##### Returns

True is the checksum is correct, false otherwise.

Referenced by SharedParamsValidateBuffer().

#### 7.1166.2.7 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

##### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

##### Returns

True if successful, false otherwise.

### 7.1166.2.8 SharedParamsWriteChecksum()

```
static void SharedParamsWriteChecksum (
 void) [static]
```

Calculates and writes the checksum into the buffer.

#### Returns

none.

Referenced by SharedParamsInit(), and SharedParamsWriteByIndex().

## 7.1167 shared\_params.c File Reference

### 7.1167.1 Detailed Description

Shared RAM parameters source file.

### 7.1167.2 Function Documentation

#### 7.1167.2.1 SharedParamsCalculateChecksum()

```
static uint16_t SharedParamsCalculateChecksum (
 void) [static]
```

Calculates and returns the checksum value for the current contents in the buffer. The checksum is calculated by taking the sum of all bytes in the parameter buffer (excluding the checksum at the end) and then taking the two's complement value of it.

#### Returns

The calculated checksum value.

Referenced by [SharedParamsVerifyChecksum\(\)](#), and [SharedParamsWriteChecksum\(\)](#).

### 7.1167.2.2 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

### 7.1167.2.3 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

#### Returns

True if successful, false otherwise.

### 7.1167.2.4 SharedParamsValidateBuffer()

```
static bool SharedParamsValidateBuffer (
 void) [static]
```

Validates the shared parameter buffer contents by looking at the table identifier and verifying its checksum.

#### Returns

True if successful, false otherwise.

Referenced by SharedParamsInit(), SharedParamsReadByIndex(), and SharedParamsWriteByIndex().

### 7.1167.2.5 SharedParamsVerifyChecksum()

```
static bool SharedParamsVerifyChecksum (
 void) [static]
```

Calculates and verifies the checksum that is currently present in the buffer.

#### Returns

True is the checksum is correct, false otherwise.

Referenced by SharedParamsValidateBuffer().

### 7.1167.2.6 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

#### Returns

True if successful, false otherwise.

### 7.1167.2.7 SharedParamsWriteChecksum()

```
static void SharedParamsWriteChecksum (
 void) [static]
```

Calculates and writes the checksum into the buffer.

#### Returns

none.

Referenced by SharedParamsInit(), and SharedParamsWriteByIndex().

### 7.1167.3 Variable Documentation

#### 7.1167.3.1 shared

```
__no_init tSharedParamsBuffer sharedParamsBuffer shared [static]
```

Declaration of the actual parameter buffer that this module manages.

#### Warning

For the shared RAM parameters to work properly for sharing information between the bootloader and user program, it is important that this variable is linked to the exact same RAM address in both the bootloader and the user program. Additionally, it should be configured such that the C-startup code does NOT zero its contents during system initialization. This is the code that runs in the reset event handler, before function `main()` is called. For GCC based embedded toolchains, the solution is to assign this variable to a custom section, in this case called ".shared". Then in the linker script, add the following to the SECTIONS:

```
.shared (NOLOAD) : { . = ALIGN(4); _sshared = .; shared_start = _sshared; *(.shared) *(.shared.*) KE←
EP(*(.(shared))) . = ALIGN(4); _eshared = .; shared_end = _eshared; } >SHARED
```

Next, add a new MEMORY entry for SHARED at the start of RAM and reduce the length of the remaining RAM:

```
SHARED (xrw) : ORIGIN = 0x200000C0, LENGTH = 64 RAM (xrw) : ORIGIN = 0x20000100, LENGTH = 32K - 192
- 64
```

Note that the previous example is for an STM32F0 microcontroller where the first 192 (0xC0) bytes in RAM are reserved for the user program vector table.

#### Remarks

This same approach can be applied with other toolchains such as Keil MDK and IAR EWARM. Consult the compiler and linker user manuals of your toolchain to find out how to place a RAM variable at a fixed memory address and to prevent the C-startup code from zeroing its contents. Here are a few links to get you started:

### 7.1168.1 Detailed Description

Shared RAM parameters source file.

### 7.1168.2 Function Documentation

#### 7.1168.2.1 SharedParamsCalculateChecksum()

```
static uint16_t SharedParamsCalculateChecksum (
 void) [static]
```

Calculates and returns the checksum value for the current contents in the buffer. The checksum is calculated by taking the sum of all bytes in the parameter buffer (excluding the checksum at the end) and then taking the two's complement value of it.

#### Returns

The calculated checksum value.

Referenced by SharedParamsVerifyChecksum(), and SharedParamsWriteChecksum().

#### 7.1168.2.2 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

#### 7.1168.2.3 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

**Parameters**

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

**Returns**

True if successful, false otherwise.

**7.1168.2.4 SharedParamsValidateBuffer()**

```
static bool SharedParamsValidateBuffer (
 void) [static]
```

Validates the shared parameter buffer contents by looking at the table identifier and verifying its checksum.

**Returns**

True if successful, false otherwise.

Referenced by SharedParamsInit(), SharedParamsReadByIndex(), and SharedParamsWriteByIndex().

**7.1168.2.5 SharedParamsVerifyChecksum()**

```
static bool SharedParamsVerifyChecksum (
 void) [static]
```

Calculates and verifies the checksum that is currently present in the buffer.

**Returns**

True is the checksum is correct, false otherwise.

Referenced by SharedParamsValidateBuffer().

**7.1168.2.6 SharedParamsWriteByIndex()**

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

## Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

## Returns

True if successful, false otherwise.

## 7.1168.2.7 SharedParamsWriteChecksum()

```
static void SharedParamsWriteChecksum (
 void) [static]
```

Calculates and writes the checksum into the buffer.

## Returns

none.

Referenced by SharedParamsInit(), and SharedParamsWriteByIndex().

## 7.1168.3 Variable Documentation

## 7.1168.3.1 shared

```
__no_init tSharedParamsBuffer sharedParamsBuffer shared [static]
```

Declaration of the actual parameter buffer that this module manages.

## Warning

For the shared RAM parameters to work properly for sharing information between the bootloader and user program, it is important that this variable is linked to the exact same RAM address in both the bootloader and the user program. Additionally, it should be configured such that the C-startup code does NOT zero its contents during system initialization. This is the code that runs in the reset event handler, before function `main()` is called. For GCC based embedded toolchains, the solution is to assign this variable to a custom section, in this case called ".shared". Then in the linker script, add the following to the SECTIONS:

```
.shared (NOLOAD) : { . = ALIGN(4); _sshared = .; shared_start = _sshared; *(.shared) *(.shared.*) KE←
EP(*(.shared)) . = ALIGN(4); _eshared = .; shared_end = _eshared; } >SHARED
```

Next, add a new MEMORY entry for SHARED at the start of RAM and reduce the length of the remaining RAM:

```
SHARED (xrw) : ORIGIN = 0x200000C0, LENGTH = 64 RAM (xrw) : ORIGIN = 0x20000100, LENGTH = 32K - 192
- 64
```

Note that the previous example is for an STM32F0 microcontroller where the first 192 (0xC0) bytes in RAM are reserved for the user program vector table.

## Remarks

### 7.1169.1 Detailed Description

Shared RAM parameters source file.

### 7.1169.2 Function Documentation

#### 7.1169.2.1 \_\_attribute\_\_()

```
static tSharedParamsBuffer sharedParamsBuffer __attribute__ (
 (section("shared"), zero_init)) [static]
```

Declaration of the actual parameter buffer that this module manages.

#### Warning

For the shared RAM parameters to work properly for sharing information between the bootloader and user program, it is important that this variable is linked to the exact same RAM address in both the bootloader and the user program. Additionally, it should be configured such that the C-startup code does NOT zero its contents during system initialization. This is the code that runs in the reset event handler, before function [main\(\)](#) is called. For GCC based embedded toolchains, the solution is to assign this variable to a custom section, in this case called ".shared". Then in the linker script, add the following to the SECTIONS:

```
.shared (NOLOAD) : { . = ALIGN(4); _sshared = .; shared_start = _sshared; *(.shared) *(.shared.*) KE↔
EP(*(.shared)) . = ALIGN(4); _eshared = .; shared_end = _eshared; } >SHARED
```

Next, add a new MEMORY entry for SHARED at the start of RAM and reduce the length of the remaining RAM:

```
SHARED (xrw) : ORIGIN = 0x200000C0, LENGTH = 64 RAM (xrw) : ORIGIN = 0x20000100, LENGTH = 32K - 192
- 64
```

Note that the previous example is for an STM32F0 microcontroller where the first 192 (0xC0) bytes in RAM are reserved for the user program vector table.

#### Remarks

This same approach can be applied with other toolchains such as Keil MDK and IAR EWARM. Consult the compiler and linker user manuals of your toolchain to find out how to place a RAM variable at a fixed memory address and to prevent the C-startup code from zeroing its contents. Here are a few links to get you started:

- IAR EWARM: <https://www.iar.com/support/tech-notes/compiler/linker-error-for-absolute-located-variable/>
- Keil MDK: <http://www.keil.com/support/docs/3480.htm>

#### 7.1169.2.2 SharedParamsCalculateChecksum()

```
static uint16_t SharedParamsCalculateChecksum (
 void) [static]
```

Calculates and returns the checksum value for the current contents in the buffer. The checksum is calculated by taking the sum of all bytes in the parameter buffer (excluding the checksum at the end) and then taking the two's complement value of it.

##### Returns

The calculated checksum value.

Referenced by SharedParamsVerifyChecksum(), and SharedParamsWriteChecksum().

#### 7.1169.2.3 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

##### Returns

none.

#### 7.1169.2.4 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

##### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

##### Returns

True if successful, false otherwise.

### 7.1169.2.5 SharedParamsValidateBuffer()

```
static bool SharedParamsValidateBuffer (
 void) [static]
```

Validates the shared parameter buffer contents by looking at the table identifier and verifying its checksum.

#### Returns

True if successful, false otherwise.

Referenced by SharedParamsInit(), SharedParamsReadByIndex(), and SharedParamsWriteByIndex().

### 7.1169.2.6 SharedParamsVerifyChecksum()

```
static bool SharedParamsVerifyChecksum (
 void) [static]
```

Calculates and verifies the checksum that is currently present in the buffer.

#### Returns

True is the checksum is correct, false otherwise.

Referenced by SharedParamsValidateBuffer().

### 7.1169.2.7 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

#### Returns

True if successful, false otherwise.

### 7.1169.2.8 SharedParamsWriteChecksum()

```
static void SharedParamsWriteChecksum (
 void) [static]
```

Calculates and writes the checksum into the buffer.

#### Returns

none.

Referenced by SharedParamsInit(), and SharedParamsWriteByIndex().

## 7.1170 shared\_params.c File Reference

Shared RAM parameters source file.

```
#include <stddef.h>
#include "shared_params.h"
```

Include dependency graph for ARMCM7\_STM32F7\_Nucleo\_F767ZI\_Keil/Prog/shared\_params.c:

## Data Structures

- struct [tSharedParamsBuffer](#)

*Layout of the shared parameters RAM buffer.*

## Macros

- #define [SHARED\\_PARAMS\\_BUFFER\\_ID](#) (0xCE42E7A2u)

*Constant parameter buffer identifier. This value is always located as the start of the buffer to validate the the RAM contains valid shared parameters.*

## Functions

- static `tSharedParamsBuffer` sharedParamsBuffer `__attribute__` ((section("shared"), zero\_init))  
*Declaration of the actual parameter buffer that this module manages.*
- static bool `SharedParamsValidateBuffer` (void)  
*Validates the shared parameter buffer contents by looking at the table identifier and verifying its checksum.*
- static void `SharedParamsWriteChecksum` (void)  
*Calculates and writes the checksum into the buffer.*
- static bool `SharedParamsVerifyChecksum` (void)  
*Calculates and verifies the checksum that is currently present in the buffer.*
- static uint16\_t `SharedParamsCalculateChecksum` (void)  
*Calculates and returns the checksum value for the current contents in the buffer. The checksum is calculated by taking the sum of all bytes in the parameter buffer (excluding the checksum at the end) and then taking the two's complement value of it.*
- void `SharedParamsInit` (void)  
*Initializes the shared RAM parameters module.*
- bool `SharedParamsReadByIndex` (uint32\_t idx, uint8\_t \*value)  
*Reads a data byte from the shared parameter buffer at the specified index.*
- bool `SharedParamsWriteByIndex` (uint32\_t idx, uint8\_t value)  
*Writes a data byte to the shared parameter buffer at the specified index.*

### 7.1170.1 Detailed Description

Shared RAM parameters source file.

### 7.1170.2 Function Documentation

#### 7.1170.2.1 `__attribute__`()

```
static tSharedParamsBuffer sharedParamsBuffer __attribute__ (
 (section("shared"), zero_init)) [static]
```

Declaration of the actual parameter buffer that this module manages.

#### Warning

For the shared RAM parameters to work properly for sharing information between the bootloader and user program, it is important that this variable is linked to the exact same RAM address in both the bootloader and the user program. Additionally, it should be configured such that the C-startup code does NOT zero its contents during system initialization. This is the code that runs in the reset event handler, before function `main()` is called. For GCC based embedded toolchains, the solution is to assign this variable to a custom section, in this case called ".shared". Then in the linker script, add the following to the SECTIONS:

```
.shared (NOLOAD) : { . = ALIGN(4); _sshared = .; shared_start = _sshared; *(.shared) *(.shared.*) KE←
EP(*(.shared)) . = ALIGN(4); _eshared = .; shared_end = _eshared; } >SHARED
```

Next, add a new MEMORY entry for SHARED at the start of RAM and reduce the length of the remaining RAM:

```
SHARED (xrw) : ORIGIN = 0x200000C0, LENGTH = 64 RAM (xrw) : ORIGIN = 0x20000100, LENGTH = 32K - 192
- 64
```

Note that the previous example is for an STM32F0 microcontroller where the first 192 (0xC0) bytes in RAM are reserved for the user program vector table.

## Remarks

This same approach can be applied with other toolchains such as Keil MDK and IAR EWARM. Consult the compiler and linker user manuals of your toolchain to find out how to place a RAM variable at a fixed memory address and to prevent the C-startup code from zeroing its contents. Here are a few links to get you started:

- IAR EWARM: <https://www.iar.com/support/tech-notes/compiler/linker-error-for-absolute-located-variable/>
- Keil MDK: <http://www.keil.com/support/docs/3480.htm>

### 7.1170.2.2 SharedParamsCalculateChecksum()

```
static uint16_t SharedParamsCalculateChecksum (
 void) [static]
```

Calculates and returns the checksum value for the current contents in the buffer. The checksum is calculated by taking the sum of all bytes in the parameter buffer (excluding the checksum at the end) and then taking the two's complement value of it.

## Returns

The calculated checksum value.

Referenced by SharedParamsVerifyChecksum(), and SharedParamsWriteChecksum().

### 7.1170.2.3 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

## Returns

none.

### 7.1170.2.4 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

**Parameters**

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

**Returns**

True if successful, false otherwise.

**7.1170.2.5 SharedParamsValidateBuffer()**

```
static bool SharedParamsValidateBuffer (
 void) [static]
```

Validates the shared parameter buffer contents by looking at the table identifier and verifying its checksum.

**Returns**

True if successful, false otherwise.

Referenced by SharedParamsInit(), SharedParamsReadByIndex(), and SharedParamsWriteByIndex().

**7.1170.2.6 SharedParamsVerifyChecksum()**

```
static bool SharedParamsVerifyChecksum (
 void) [static]
```

Calculates and verifies the checksum that is currently present in the buffer.

**Returns**

True is the checksum is correct, false otherwise.

Referenced by SharedParamsValidateBuffer().

**7.1170.2.7 SharedParamsWriteByIndex()**

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

**Parameters**

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

**Returns**

True if successful, false otherwise.

**7.1170.2.8 SharedParamsWriteChecksum()**

```
static void SharedParamsWriteChecksum (
 void) [static]
```

Calculates and writes the checksum into the buffer.

**Returns**

none.

Referenced by SharedParamsInit(), and SharedParamsWriteByIndex().

**7.1171 shared\_params.h File Reference**

Shared RAM parameters header file.

```
#include <stdint.h>
#include <stdbool.h>

### 7.1171.1 Detailed Description

Shared RAM parameters header file.

### 7.1171.2 Function Documentation

#### 7.1171.2.1 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

### 7.1171.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

#### Returns

True if successful, false otherwise.

### 7.1171.2.3 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

#### Returns

True if successful, false otherwise.

## 7.1172 shared\_params.h File Reference

none.

#### 7.1176.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

**Returns**

True if successful, false otherwise.

**7.1176.2.3 SharedParamsWriteByIndex()**

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

**Parameters**

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

**Returns**

True if successful, false otherwise.

### 7.1177.1 Detailed Description

Shared RAM parameters header file.

### 7.1177.2 Function Documentation

#### 7.1177.2.1 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

### 7.1177.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

#### Returns

True if successful, false otherwise.

### 7.1177.2.3 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

#### Returns

True if successful, false otherwise.

### 7.1183.1 Detailed Description

Shared RAM parameters header file.

### 7.1183.2 Function Documentation

#### 7.1183.2.1 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

### 7.1183.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

#### Returns

True if successful, false otherwise.

### 7.1183.2.3 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

#### Returns

True if successful, false otherwise.

## 7.1184 shared\_params.h File Reference

Shared RAM parameters header file.

```
#include <stdint.h>
#include <stdbool.h>
```

Include dependency graph for ARMC7\_STM32F7\_Nucleo\_F767ZI\_CubeIDE/Boot/App/shared\_params.h:

## Macros

- `#define SHARED_PARAMS_CFG_BUFFER_DATA_LEN (56u)`  
*Configuration macro for specifying the size of the data inside the parameter buffer. This is the length in bytes of the actual parameter data, so excluding the bufferId and checksum.*

## Functions

- void `SharedParamsInit` (void)  
*Initializes the shared RAM parameters module.*
- bool `SharedParamsReadByIndex` (uint32\_t idx, uint8\_t \*value)  
*Reads a data byte from the shared parameter buffer at the specified index.*
- bool `SharedParamsWriteByIndex` (uint32\_t idx, uint8\_t value)  
*Writes a data byte to the shared parameter buffer at the specified index.*

### 7.1184.1 Detailed Description

Shared RAM parameters header file.

## 7.1184.2 Function Documentation

### 7.1184.2.1 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

### 7.1184.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

#### Returns

True if successful, false otherwise.

### 7.1184.2.3 SharedParamsWriteByIndex()

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

### Returns

True if successful, false otherwise.

## 7.1185 shared\_params.h File Reference

Shared RAM parameters header file.

### 7.1185.1 Detailed Description

Shared RAM parameters header file.

### 7.1185.2 Function Documentation

#### 7.1185.2.1 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

#### 7.1185.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

**Returns**

True if successful, false otherwise.

**7.1185.2.3 SharedParamsWriteByIndex()**

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

**Parameters**

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

**Returns**

True if successful, false otherwise.

*Initializes the shared RAM parameters module.*
- bool [SharedParamsReadByIndex](#) (uint32\_t idx, uint8\_t \*value)  
*Reads a data byte from the shared parameter buffer at the specified index.*
- bool [SharedParamsWriteByIndex](#) (uint32\_t idx, uint8\_t value)  
*Writes a data byte to the shared parameter buffer at the specified index.*

### 7.1191.1 Detailed Description

Shared RAM parameters header file.

### 7.1191.2 Function Documentation

#### 7.1191.2.1 SharedParamsInit()

```
void SharedParamsInit (
 void)
```

Initializes the shared RAM parameters module.

#### Returns

none.

Referenced by [ApplInit\(\)](#), and [main\(\)](#).

#### 7.1191.2.2 SharedParamsReadByIndex()

```
bool SharedParamsReadByIndex (
 uint32_t idx,
 uint8_t * value)
```

Reads a data byte from the shared parameter buffer at the specified index.

#### Parameters

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Pointer to where the read data value is stored.                                                              |

**Returns**

True if successful, false otherwise.

Referenced by `ApplInit()`, and `main()`.

**7.1191.2.3 SharedParamsWriteByIndex()**

```
bool SharedParamsWriteByIndex (
 uint32_t idx,
 uint8_t value)
```

Writes a data byte to the shared parameter buffer at the specified index.

**Parameters**

|              |                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------|
| <i>idx</i>   | Index into the parameter data array. A valid value is between 0 and (SHARED_PARAMS_CFG_BUFFER_DATA_LEN - 1). |
| <i>value</i> | Value to write.                                                                                              |

**Returns**

True if successful, false otherwise.

Referenced by `ApplInit()`, `main()`, and `NetApp()`.

**7.1192 time.c File Reference**

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3\_LM3S\_EK\_LM3S6965\_GCC/Prog/time.c:

**Functions**

- void **TimerInit** (void)  
*Initializes the timer.*
- void **TimerDeinit** (void)  
*Stops and disables the timer.*
- void **TimerSet** (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*

## 7.1192.1 Detailed Description

Timer driver source file.

## 7.1192.2 Function Documentation

### 7.1192.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1192.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1192.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1192.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

## Returns

none.

## 7.1192.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

## Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

## Returns

none.

Referenced by TimerInit().

## 7.1193 time.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for ARMCM3\_LM3S\_EK\_LM3S6965\_IAR/Prog/time.c:

## Functions

### 7.1193.1 Detailed Description

Timer driver source file.

### 7.1193.2 Function Documentation

#### 7.1193.2.1 `TimerDeinit()`

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

#### 7.1193.2.2 `TimerGet()`

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1193.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1193.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1193.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

#### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

#### Returns

none.

Referenced by TimerInit().

## 7.1194 time.c File Reference

### 7.1194.1 Detailed Description

Timer driver source file.

### 7.1194.2 Function Documentation

#### 7.1194.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1194.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1194.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1194.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1194.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

#### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

### 7.1195.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1195.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1195.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1195.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1195.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

## 7.1196.2 Function Documentation

### 7.1196.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1196.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1196.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1196.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1196.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

**Parameters**

|                          |                                            |
|--------------------------|--------------------------------------------|
| <code>timer_value</code> | initialize value of the millisecond timer. |
|--------------------------|--------------------------------------------|

**Returns**

none.

Referenced by `TimerInit()`.

- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1206.1 Detailed Description

Timer driver source file.

### 7.1206.2 Function Documentation

### 7.1206.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1206.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1206.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1207 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0\_STM32F0\_Nucleo\_F091RC\_CubeIDE/Prog/App/timer.c:

## Functions

- void `TimerInit` (void)  
*Initializes the timer.*
- unsigned long `TimerGet` (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1207.1 Detailed Description

Timer driver source file.

### 7.1207.2 Function Documentation

#### 7.1207.2.1 `TimerGet()`

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

#### 7.1207.2.2 `TimerInit()`

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1208 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0\_STM32F0\_Nucleo\_F091RC\_GCC/Prog/timer.c:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1208.1 Detailed Description

Timer driver source file.

### 7.1208.2 Function Documentation

#### 7.1208.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1208.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1208.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

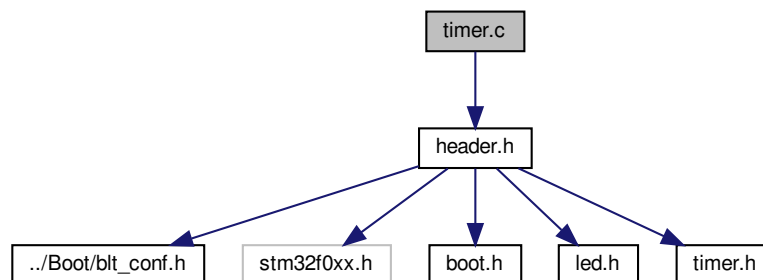

none.

## 7.1209 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM0\_STM32F0\_Nucleo\_F091RC\_IAR/Prog/timer.c:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*

*Local variable for storing the number of milliseconds that have elapsed since startup.*

### 7.1215.1 Detailed Description

Timer driver source file.

### 7.1215.2 Function Documentation

#### 7.1215.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

##### Returns

none.

#### 7.1215.2.2 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

##### Returns

none.

#### 7.1215.2.3 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1215.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

#### 7.1215.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

##### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

##### Returns

none.

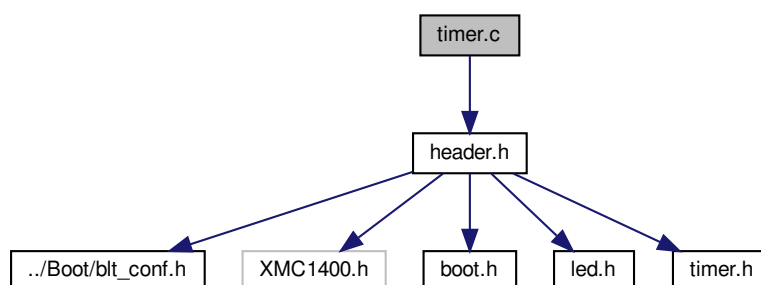

Referenced by TimerInit().

## 7.1216 timer.c File Reference

Timer driver source file.

Timer driver source file.

### 7.1221.2 Function Documentation

#### 7.1221.2.1 [TimerDeinit\(\)](#)

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

#### 7.1221.2.2 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1221.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1221.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

Referenced by `__attribute__()`.

### 7.1221.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

#### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

#### Returns

none.

Referenced by `TimerInit()`.

Timer driver source file.

### 7.1222.2 Function Documentation

#### 7.1222.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1222.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1222.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1222.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1222.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

#### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

**Returns**

none.

Referenced by TimerInit().

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1226.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1227 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3\_STM32F1\_Olimex\_STM32H103\_CubeIDE/Prog/App/timer.c:

### Functions

- void `TimerInit` (void)  
*Initializes the timer.*
- unsigned long `TimerGet` (void)  
*Obtains the counter value of the millisecond timer.*

#### 7.1227.1 Detailed Description

Timer driver source file.

#### 7.1227.2 Function Documentation

##### 7.1227.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

### 7.1227.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1228 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3\_STM32F1\_Olimex\_STM32H103\_GCC/Prog/timer.c:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1228.1 Detailed Description

Timer driver source file.

## 7.1228.2 Function Documentation

### 7.1228.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1228.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1228.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1229 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3\_STM32F1\_Olimex\_STM32H103\_IAR/Prog/timer.c:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1229.1 Detailed Description

Timer driver source file.

### 7.1229.2 Function Documentation

#### 7.1229.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1229.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1229.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1230 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM3\_STM32F1\_Olimex\_STM32H103\_Keil/Prog/timer.c:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1230.1 Detailed Description

Timer driver source file.

### 7.1230.2 Function Documentation

#### 7.1230.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

#### 7.1230.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1230.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1231 timer.c File Reference

Timer driver source file.

```
#include "header.h"

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4\_STM32F3\_Nucleo\_F303K8\_IAR/Prog/timer.c:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1251.1 Detailed Description

Timer driver source file.

### 7.1251.2 Function Documentation

#### 7.1251.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

#### 7.1251.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1251.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

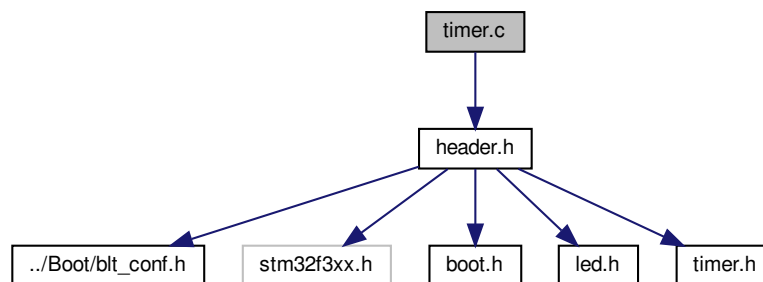

none.

## 7.1252 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4\_STM32F3\_Nucleo\_F303K8\_Keil/Prog/timer.c:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1252.1 Detailed Description

Timer driver source file.

### 7.1252.2 Function Documentation

### 7.1252.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1252.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1252.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

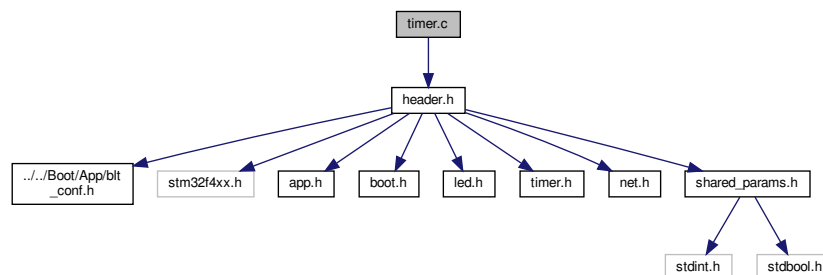

none.

## 7.1253 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4\_STM32F4\_Nucleo\_F429ZI\_CubeIDE/Prog/App/timer.c:

## Functions

- void `TimerInit` (void)  
*Initializes the timer.*
- unsigned long `TimerGet` (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1253.1 Detailed Description

Timer driver source file.

### 7.1253.2 Function Documentation

#### 7.1253.2.1 `TimerGet()`

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

#### 7.1253.2.2 `TimerInit()`

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

## 7.1254 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4\_STM32F4\_Nucleo\_F429ZI\_GCC/Prog/timer.c:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*

*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1254.1 Detailed Description

Timer driver source file.

### 7.1254.2 Function Documentation

#### 7.1254.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1254.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1254.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

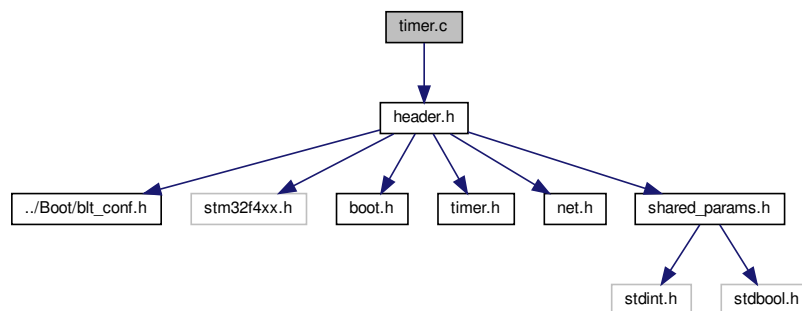

none.

## 7.1255 timer.c File Reference

Timer driver source file.

```
#include "header.h"

Timer driver source file.

### 7.1264.2 Function Documentation

#### 7.1264.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

##### Returns

none.

#### 7.1264.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1264.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

## 7.1265 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4\_XMC4\_XMC4700\_Relax\_Kit\_GCC/Prog/timer.c:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [SysTick\\_Handler](#) (void)  
*Interrupt service routine of the timer.*

### Variables

- static unsigned long [millisecond\\_counter](#)  
*Local variable for storing the number of milliseconds that have elapsed since startup.*

#### 7.1265.1 Detailed Description

Timer driver source file.

#### 7.1265.2 Function Documentation

### 7.1265.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1265.2.2 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1265.2.3 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1265.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1265.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

## Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

## Returns

none.

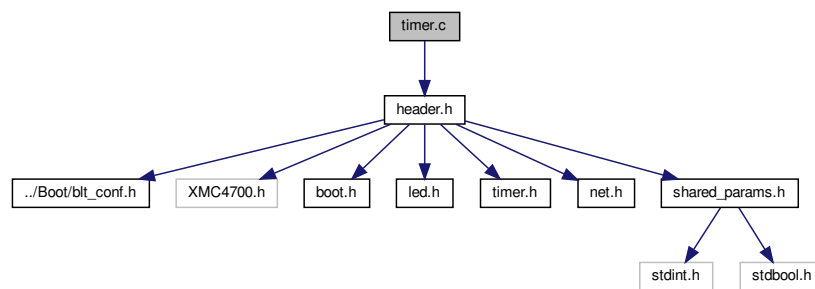

Referenced by TimerInit().

## 7.1266 timer.c File Reference

Timer driver source file.

```
#include "header.h"
```

Include dependency graph for Demo/ARMCM4\_XMC4\_XMC4700\_Relax\_Kit\_IAR/Prog/timer.c:

## Functions

- void [TimerInit](#) (void)

## 7.1266.1 Detailed Description

Timer driver source file.

## 7.1266.2 Function Documentation

### 7.1266.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1266.2.2 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1266.2.3 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

#### 7.1266.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

#### 7.1266.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

##### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

##### Returns

none.

Referenced by TimerInit().

## 7.1267 timer.c File Reference

### 7.1273.2.1 SysTick\_Handler()

```
void SysTick_Handler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1273.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1273.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

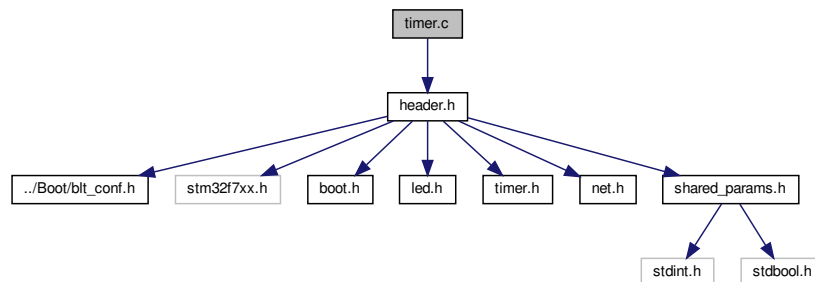

none.

## 7.1274 timer.c File Reference

Timer driver source file.

```

Timer driver source file.

## 7.1279.2 Function Documentation

### 7.1279.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

Referenced by TimerInit().

### 7.1279.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1279.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

### 7.1279.2.4 TimerISRHandler()

```
__interrupt void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1279.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

**Parameters**

|                          |                                            |
|--------------------------|--------------------------------------------|
| <code>timer_value</code> | initialize value of the millisecond timer. |
|--------------------------|--------------------------------------------|

**Returns**

none.

Referenced by TimerInit().

**7.1280 timer.c File Reference**

## 7.1280.1 Detailed Description

Timer driver source file.

## 7.1280.2 Function Documentation

### 7.1280.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

Referenced by TimerInit().

### 7.1280.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1280.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

#### 7.1280.2.4 TimerISRHandler()

```
__interrupt void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

##### Returns

none.

#### 7.1280.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

##### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

##### Returns

none.

Referenced by TimerInit().

### 7.1283.1 Detailed Description

Bootloader timer driver source file.

### 7.1283.2 Function Documentation

#### 7.1283.2.1 HAL\_GetTick()

```
uint32_t HAL_GetTick (
 void)
```

Override for the HAL driver's GetTick() functionality. This is needed because the bootloader doesn't use interrupts, but the HAL's tick functionality assumes that it does. This will cause the HAL\_Delay() function to not work properly. As a result of this override, the HAL's tick functionality works in polling mode.

#### Returns

Current value of the millisecond timer.

Referenced by [TimerGet](#)().

### 7.1283.2.2 SysTick\_Handler()

```
__weak void SysTick_Handler (
 void)
```

This function handles the SysTick interrupt. The HAL driver is initialized before this timer driver. The HAL driver configures the SysTick for interrupt driven mode, which is afterwards disabled by the timer driver initialization. It is theoretically possible that the SysTick interrupt still fires before the timer driver disables it. Therefore the handler is implemented here. If not, then the default handler from cstart.s is used, which hangs the system.

#### Returns

none.

### 7.1283.2.3 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

Referenced by HAL\_GetTick().

### 7.1283.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the polling based millisecond timer driver.

Initializes the timer.

#### Returns

none.

### 7.1283.2.5 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

#### Returns

none.

Referenced by TimerInit().

### 7.1283.2.6 TimerUpdate()

```
void TimerUpdate (
 void)
```

Updates the millisecond timer.

#### Returns

none.

Referenced by TimerGet().

#### 7.1289.1 Detailed Description

Bootloader timer driver source file.

## 7.1289.2 Function Documentation

### 7.1289.2.1 HAL\_GetTick()

```
uint32_t HAL_GetTick (
 void)
```

Override for the HAL driver's GetTick() functionality. This is needed because the bootloader doesn't use interrupts, but the HAL's tick functionality assumes that it does. This will cause the HAL\_Delay() function to not work properly. As a result of this override, the HAL's tick functionality works in polling mode.

#### Returns

Current value of the millisecond timer.

### 7.1289.2.2 SysTick\_Handler()

```
__weak void SysTick_Handler (
 void)
```

This function handles the SysTick interrupt. The HAL driver is initialized before this timer driver. The HAL driver configures the SysTick for interrupt driven mode, which is afterwards disabled by the timer driver initialization. It is theoretically possible that the SysTick interrupt still fires before the timer driver disables it. Therefore the handler is implemented here. If not, then the default handler from cstart.s is used, which hangs the system.

#### Returns

none.

### 7.1289.2.3 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

Referenced by HAL\_GetTick().

#### 7.1289.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the polling based millisecond timer driver.

Initializes the timer.

##### Returns

none.

#### 7.1289.2.5 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

##### Returns

none.

Referenced by TimerInit().

#### 7.1289.2.6 TimerUpdate()

```
void TimerUpdate (
 void)
```

Updates the millisecond timer.

##### Returns

none.

Referenced by TimerGet().

#### 7.1290.1 Detailed Description

Bootloader timer driver source file.

## 7.1290.2 Function Documentation

### 7.1290.2.1 HAL\_GetTick()

```
uint32_t HAL_GetTick (
 void)
```

Override for the HAL driver's GetTick() functionality. This is needed because the bootloader doesn't use interrupts, but the HAL's tick functionality assumes that it does. This will cause the HAL\_Delay() function to not work properly. As a result of this override, the HAL's tick functionality works in polling mode.

#### Returns

Current value of the millisecond timer.

### 7.1290.2.2 SysTick\_Handler()

```
__weak void SysTick_Handler (
 void)
```

This function handles the SysTick interrupt. The HAL driver is initialized before this timer driver. The HAL driver configures the SysTick for interrupt driven mode, which is afterwards disabled by the timer driver initialization. It is theoretically possible that the SysTick interrupt still fires before the timer driver disables it. Therefore the handler is implemented here. If not, then the default handler from cstart.s is used, which hangs the system.

#### Returns

none.

### 7.1290.2.3 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

Referenced by HAL\_GetTick().

#### 7.1290.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the polling based millisecond timer driver.

Initializes the timer.

##### Returns

none.

#### 7.1290.2.5 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

##### Returns

none.

### 7.1296.1 Detailed Description

Bootloader timer driver source file.

### 7.1296.2 Function Documentation

#### 7.1296.2.1 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1296.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the polling based millisecond timer driver.

Initializes the timer.

##### Returns

none.

#### 7.1296.2.3 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

##### Returns

none.

Referenced by TimerInit().

#### 7.1296.2.4 TimerUpdate()

```
void TimerUpdate (
 void)
```

Updates the millisecond timer.

##### Returns

none.

Referenced by TimerGet().

## 7.1297 timer.c File Reference

Bootloader timer driver source file.

```
#include "boot.h"
#include "stm32f7xx.h"
```

*Local variable for storing the number of milliseconds that have elapsed since startup.*

#### 7.1297.1 Detailed Description

Bootloader timer driver source file.

## 7.1297.2 Function Documentation

### 7.1297.2.1 HAL\_GetTick()

```
uint32_t HAL_GetTick (
 void)
```

Override for the HAL driver's GetTick() functionality. This is needed because the bootloader doesn't use interrupts, but the HAL's tick functionality assumes that it does. This will cause the HAL\_Delay() function to not work properly. As a result of this override, the HAL's tick functionality works in polling mode.

#### Returns

Current value of the millisecond timer.

### 7.1297.2.2 SysTick\_Handler()

```
__weak void SysTick_Handler (
 void)
```

This function handles the SysTick interrupt. The HAL driver is initialized before this timer driver. The HAL driver configures the SysTick for interrupt driven mode, which is afterwards disabled by the timer driver initialization. It is theoretically possible that the SysTick interrupt still fires before the timer driver disables it. Therefore the handler is implemented here. If not, then the default handler from cstart.s is used, which hangs the system.

#### Returns

none.

### 7.1297.2.3 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

Referenced by HAL\_GetTick().

#### 7.1297.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the polling based millisecond timer driver.

Initializes the timer.

##### Returns

none.

#### 7.1297.2.5 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

##### Returns

none.

Referenced by TimerInit().

#### 7.1297.2.6 TimerUpdate()

```
void TimerUpdate (
 void)
```

Updates the millisecond timer.

##### Returns

none.

Referenced by TimerGet().

## 7.1298 timer.c File Reference

Bootloader timer driver source file.

#### 7.1298.1 Detailed Description

Bootloader timer driver source file.

## 7.1298.2 Function Documentation

### 7.1298.2.1 HAL\_GetTick()

```
uint32_t HAL_GetTick (
 void)
```

Override for the HAL driver's GetTick() functionality. This is needed because the bootloader doesn't use interrupts, but the HAL's tick functionality assumes that it does. This will cause the HAL\_Delay() function to not work properly. As a result of this override, the HAL's tick functionality works in polling mode.

#### Returns

Current value of the millisecond timer.

### 7.1298.2.2 SysTick\_Handler()

```
__weak void SysTick_Handler (
 void)
```

This function handles the SysTick interrupt. The HAL driver is initialized before this timer driver. The HAL driver configures the SysTick for interrupt driven mode, which is afterwards disabled by the timer driver initialization. It is theoretically possible that the SysTick interrupt still fires before the timer driver disables it. Therefore the handler is implemented here. If not, then the default handler from cstart.s is used, which hangs the system.

#### Returns

none.

### 7.1298.2.3 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

Referenced by HAL\_GetTick().

#### 7.1298.2.4 TimerInit()

```
void TimerInit (
 void)
```

Initializes the polling based millisecond timer driver.

Initializes the timer.

##### Returns

none.

#### 7.1298.2.5 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

##### Returns

none.

Referenced by TimerInit().

#### 7.1298.2.6 TimerUpdate()

```
void TimerUpdate (
 void)
```

Updates the millisecond timer.

##### Returns

none.

Referenced by TimerGet().

void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1317 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1317.1 Detailed Description

Timer driver header file.

### 7.1317.2 Function Documentation

#### 7.1317.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1317.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1318 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1318.1 Detailed Description

Timer driver header file.

## 7.1318.2 Function Documentation

### 7.1318.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1318.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1319 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [TimerISRHandler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1319.1 Detailed Description

Timer driver header file.

### 7.1319.2 Function Documentation

#### 7.1319.2.1 [TimerDeinit\(\)](#)

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

##### Returns

none.

#### 7.1319.2.2 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

### 7.1319.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

### 7.1319.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

### 7.1319.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

#### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

#### Returns

none.

## 7.1320 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [TimerISRHandler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1320.1 Detailed Description

Timer driver header file.

### 7.1320.2 Function Documentation

#### 7.1320.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

##### Returns

none.

#### 7.1320.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1320.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

#### 7.1320.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

##### Returns

none.

#### 7.1320.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

## Parameters

|                          |                                            |
|--------------------------|--------------------------------------------|
| <code>timer_value</code> | initialize value of the millisecond timer. |
|--------------------------|--------------------------------------------|

## Returns

none.

## 7.1321 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1321.1 Detailed Description

Timer driver header file.

### 7.1321.2 Function Documentation

### 7.1321.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1321.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1322 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1322.1 Detailed Description

Timer driver header file.

### 7.1322.2 Function Documentation

#### 7.1322.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1322.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1323 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1323.1 Detailed Description

Timer driver header file.

### 7.1323.2 Function Documentation

#### 7.1323.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1323.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1324 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1324.1 Detailed Description

Timer driver header file.

## 7.1324.2 Function Documentation

### 7.1324.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1324.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1325 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1325.1 Detailed Description

Timer driver header file.

### 7.1325.2 Function Documentation

#### 7.1325.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1325.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1326 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1326.1 Detailed Description

Timer driver header file.

### 7.1326.2 Function Documentation

#### 7.1326.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1326.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1327 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1327.1 Detailed Description

Timer driver header file.

## 7.1327.2 Function Documentation

### 7.1327.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1327.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1328 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1328.1 Detailed Description

Timer driver header file.

### 7.1328.2 Function Documentation

#### 7.1328.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

#### 7.1328.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1329 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1329.1 Detailed Description

Timer driver header file.

### 7.1329.2 Function Documentation

#### 7.1329.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1329.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1330 timer.h File Reference

Timer driver header file.

```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1346.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1347 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1347.1 Detailed Description

Timer driver header file.

### 7.1347.2 Function Documentation

#### 7.1347.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1347.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1348 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1348.1 Detailed Description

Timer driver header file.

## 7.1348.2 Function Documentation

### 7.1348.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1348.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1349 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1349.1 Detailed Description

Timer driver header file.

### 7.1349.2 Function Documentation

#### 7.1349.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1349.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1350 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1350.1 Detailed Description

Timer driver header file.

### 7.1350.2 Function Documentation

#### 7.1350.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1350.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1351 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1351.1 Detailed Description

Timer driver header file.

## 7.1351.2 Function Documentation

### 7.1351.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1351.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1352 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1352.1 Detailed Description

Timer driver header file.

### 7.1352.2 Function Documentation

#### 7.1352.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1352.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1353 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1353.1 Detailed Description

Timer driver header file.

### 7.1353.2 Function Documentation

#### 7.1353.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1353.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1354 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1354.1 Detailed Description

Timer driver header file.

## 7.1354.2 Function Documentation

### 7.1354.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1354.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1355 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1355.1 Detailed Description

Timer driver header file.

### 7.1355.2 Function Documentation

#### 7.1355.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1355.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1356 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*

*Obtains the counter value of the millisecond timer.*

### 7.1361.1 Detailed Description

Timer driver header file.

### 7.1361.2 Function Documentation

#### 7.1361.2.1 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1361.2.2 [TimerInit\(\)](#)

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

## 7.1362 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1362.1 Detailed Description

Timer driver header file.

### 7.1362.2 Function Documentation

#### 7.1362.2.1 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1362.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1363 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1363.1 Detailed Description

Timer driver header file.

### 7.1363.2 Function Documentation

#### 7.1363.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

##### Returns

none.

#### 7.1363.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1363.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

#### 7.1363.2.4 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

## Parameters

|                          |                                            |
|--------------------------|--------------------------------------------|
| <code>timer_value</code> | initialize value of the millisecond timer. |
|--------------------------|--------------------------------------------|

## Returns

none.

## 7.1364 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*

### 7.1364.1 Detailed Description

Timer driver header file.

## 7.1364.2 Function Documentation

### 7.1364.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

#### Returns

none.

### 7.1364.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

### 7.1364.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

### 7.1364.2.4 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

## Parameters

|                          |                                            |
|--------------------------|--------------------------------------------|
| <code>timer_value</code> | initialize value of the millisecond timer. |
|--------------------------|--------------------------------------------|

## Returns

none.

Initializes the timer.

#### Returns

none.

## 7.1377 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- \_\_interrupt void [TimerISRHandler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1377.1 Detailed Description

Timer driver header file.

### 7.1377.2 Function Documentation

#### 7.1377.2.1 TimerDeinit()

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

##### Returns

none.

#### 7.1377.2.2 TimerGet()

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

#### 7.1377.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

##### Returns

none.

Initializes the timer.

##### Returns

none.

#### 7.1377.2.4 TimerISRHandler()

```
__interrupt void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

##### Returns

none.

#### 7.1377.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

##### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

##### Returns

none.

## 7.1378 timer.h File Reference

Timer driver header file.

This graph shows which files directly or indirectly include this file:

## Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerDeinit](#) (void)  
*Stops and disables the timer.*
- void [TimerSet](#) (unsigned long timer\_value)  
*Sets the initial counter value of the millisecond timer.*
- unsigned long [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [TimerISRHandler](#) (void)  
*Interrupt service routine of the timer.*

### 7.1378.1 Detailed Description

Timer driver header file.

### 7.1378.2 Function Documentation

#### 7.1378.2.1 [TimerDeinit\(\)](#)

```
void TimerDeinit (
 void)
```

Stops and disables the timer.

##### Returns

none.

Referenced by [TimerInit\(\)](#).

#### 7.1378.2.2 [TimerGet\(\)](#)

```
unsigned long TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

##### Returns

Current value of the millisecond timer.

### 7.1378.2.3 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

### 7.1378.2.4 TimerISRHandler()

```
void TimerISRHandler (
 void)
```

Interrupt service routine of the timer.

#### Returns

none.

Referenced by `__attribute__()`.

### 7.1378.2.5 TimerSet()

```
void TimerSet (
 unsigned long timer_value)
```

Sets the initial counter value of the millisecond timer.

#### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <i>timer_value</i> | initialize value of the millisecond timer. |
|--------------------|--------------------------------------------|

#### Returns

none.

Referenced by `TimerInit()`.

## 7.1379 timer.h File Reference

Bootloader timer driver header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void [TimerInit](#) (void)  
*Initializes the timer.*
- void [TimerUpdate](#) (void)  
*Updates the millisecond timer.*
- [blt\\_int32u](#) [TimerGet](#) (void)  
*Obtains the counter value of the millisecond timer.*
- void [TimerReset](#) (void)  
*Reset the timer by placing the timer back into it's default reset configuration.*

### 7.1379.1 Detailed Description

Bootloader timer driver header file.

### 7.1379.2 Function Documentation

#### 7.1379.2.1 TimerGet()

```
blt_int32u TimerGet (
 void)
```

Obtains the counter value of the millisecond timer.

#### Returns

Current value of the millisecond timer.

Referenced by [BackDoorCheck\(\)](#), [BootComCanInit\(\)](#), [BootComRs232CheckActivationRequest\(\)](#), [CanDisabledModeEnter\(\)](#), [CanDisabledModeExit\(\)](#), [CanFreezeModeEnter\(\)](#), [CanFreezeModeExit\(\)](#), [CanInit\(\)](#), [CanTransmitPacket\(\)](#), [FileFirmwareUpdateCompletedHook\(\)](#), [FileFirmwareUpdateLogHook\(\)](#), [FlashEraseSectors\(\)](#), [FlashWriteBlock\(\)](#), [HAL\\_GetTick\(\)](#), [LedBlinkTask\(\)](#), [LedToggle\(\)](#), [NetInit\(\)](#), [NetServerTask\(\)](#), and [NetTask\(\)](#).

### 7.1379.2.2 TimerInit()

```
void TimerInit (
 void)
```

Initializes the timer.

#### Returns

none.

Initializes the timer.

#### Returns

none.

Referenced by ApplInit(), BootInit(), and Init().

### 7.1379.2.3 TimerReset()

```
void TimerReset (
 void)
```

Reset the timer by placing the timer back into it's default reset configuration.

#### Returns

none.

Referenced by CpuStartUserProgram(), and TimerInit().

### 7.1379.2.4 TimerUpdate()

```
void TimerUpdate (
 void)
```

Updates the millisecond timer.

#### Returns

none.

Referenced by BootTask(), and TimerGet().

## 7.1380 types.h File Reference

Bootloader types header file.

### Macros

- `#define BLT_TRUE (1)`

*Returns the number of data entries currently present in the fifo.*
- void `UsbInit` (void)  
*Initializes the USB communication interface.*
- void `UsbFree` (void)  
*Releases the USB communication interface.*
- void `UsbTransmitPacket` (`blt_int8u` \*data, `blt_int8u` len)  
*Transmits a packet formatted for the communication interface.*
- `blt_bool` `UsbReceivePacket` (`blt_int8u` \*data, `blt_int8u` \*len)  
*Receives a communication interface packet if one is present.*
- void `UsbTransmitPipeBulkIN` (void)  
*Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.*
- void `UsbReceivePipeBulkOUT` (void)  
*Stores data that was received on the Bulk OUT pipe in the fifo.*

## Variables

- static `tFifoCtrl` `fifoCtrl` [`FIFO_MAX_BUFFERS`]  
*Local variable that holds the fifo control structures.*
- static `tFifoCtrl` \* `fifoCtrlFree`  
*Local pointer that points to the next free fifo control structure.*
- static `tFifoPipe` `fifoPipeBulkIN`  
*Fifo pipe used for the bulk in endpoint.*
- static `tFifoPipe` `fifoPipeBulkOUT`  
*Fifo pipe used for the bulk out endpoint.*

## 7.1399.1 Detailed Description

Bootloader USB communication interface source file.

## 7.1399.2 Function Documentation

### 7.1399.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

**Parameters**

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

**Returns**

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by UsbInit().

**7.1399.2.2 UsbFifoMgrInit()**

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into fifoCtrl[]. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in fifoCtrl[] this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

**Returns**

none.

Referenced by UsbInit().

**7.1399.2.3 UsbFifoMgrRead()**

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

**Parameters**

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

**Returns**

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceiveByte(), and UsbTransmitPipeBulkIN().

#### 7.1399.2.4 UsbFifoMgrScan()

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

##### Parameters

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

##### Returns

Number of data entries in the fifo if successful, otherwise 0.

Referenced by UsbTransmitPipeBulkIN().

#### 7.1399.2.5 UsbFifoMgrWrite()

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

##### Parameters

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

##### Returns

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceivePipeBulkOUT(), and UsbTransmitByte().

#### 7.1399.2.6 UsbFree()

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

Referenced by ComFree().

### 7.1399.2.7 UsbInit()

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

#### Returns

none.

Referenced by ComInit().

### 7.1399.2.8 UsbReceiveByte()

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

#### Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

#### Returns

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by UsbReceivePacket().

### 7.1399.2.9 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

**Returns**

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

Referenced by ComTask().

**7.1399.2.10 UsbReceivePipeBulkOUT()**

```
void UsbReceivePipeBulkOUT (
 void)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

**Returns**

none.

**7.1399.2.11 UsbTransmitByte()**

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

**Parameters**

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

**Returns**

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

**7.1399.2.12 UsbTransmitPacket()**

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

**Parameters**

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

**Returns**

none.

Referenced by ComTransmitPacket().

**7.1399.2.13 UsbTransmitPipeBulkIN()**

```
static void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

**Returns**

none.

**7.1400 usb.c File Reference**

Bootloader USB communication interface source file.

```
#include "boot.h"
#include "usb.h"
#include "usbd_core.h"
#include "usbd_desc.h"
#include "usbd_bulk.h"
```

Include dependency graph for ARMCM33\_STM32L5/usb.c:

**Data Structures**

- struct [tFifoCtrl](#)  
Structure type for fifo control.
- struct [tFifoPipe](#)  
Structure type for a fifo pipe.

## Macros

- #define `FIFO_MAX_BUFFERS` (2)  
*Total number of fifo buffers.*

*USB device handle.*

### 7.1400.1 Detailed Description

Bootloader USB communication interface source file.

### 7.1400.2 Function Documentation

#### 7.1400.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

##### Parameters

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

##### Returns

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by UsbInit().

#### 7.1400.2.2 UsbFifoMgrInit()

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into fifoCtrl[]. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in fifoCtrl[] this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

##### Returns

none.

Referenced by UsbInit().

#### 7.1400.2.3 UsbFifoMgrRead()

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

**Parameters**

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

**Returns**

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceiveByte(), and UsbTransmitPipeBulkIN().

**7.1400.2.4 UsbFifoMgrScan()**

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

**Parameters**

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

**Returns**

Number of data entries in the fifo if successful, otherwise 0.

Referenced by UsbTransmitPipeBulkIN().

**7.1400.2.5 UsbFifoMgrWrite()**

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

**Parameters**

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

**Returns**

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by `UsbReceivePipeBulkOUT()`, and `UsbTransmitByte()`.

#### 7.1400.2.6 `UsbFree()`

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

#### 7.1400.2.7 `UsbInit()`

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

##### Returns

none.

#### 7.1400.2.8 `UsbReceiveByte()`

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

##### Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

##### Returns

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by `UsbReceivePacket()`.

### 7.1400.2.9 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

#### Returns

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

### 7.1400.2.10 UsbReceivePipeBulkOUT()

```
void UsbReceivePipeBulkOUT (
 blt_int8u epnum)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

#### Returns

none.

### 7.1400.2.11 UsbTransmitByte()

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

#### Parameters

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

#### Returns

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

### 7.1400.2.12 UsbTransmitPacket()

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

#### Parameters

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

#### Returns

none.

### 7.1400.2.13 UsbTransmitPipeBulkIN()

```
void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

#### Returns

none.

### 7.1401.1 Detailed Description

Bootloader USB communication interface source file.

### 7.1401.2 Function Documentation

#### 7.1401.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

#### Parameters

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

#### Returns

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by `UsbInit()`.

#### 7.1401.2.2 UsbFifoMgrInit()

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into `fifoCtrl[]`. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in `fifoCtrl[]` this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

#### Returns

none.

Referenced by `UsbInit()`.

#### 7.1401.2.3 UsbFifoMgrRead()

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

#### Parameters

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

#### Returns

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by `UsbReceiveByte()`, and `UsbTransmitPipeBulkIN()`.

#### 7.1401.2.4 UsbFifoMgrScan()

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

#### Parameters

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

#### Returns

Number of data entries in the fifo if successful, otherwise 0.

Referenced by `UsbTransmitPipeBulkIN()`.

#### 7.1401.2.5 UsbFifoMgrWrite()

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

##### Parameters

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

##### Returns

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceivePipeBulkOUT(), and UsbTransmitByte().

#### 7.1401.2.6 UsbFree()

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

#### 7.1401.2.7 UsbInit()

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

##### Returns

none.

#### 7.1401.2.8 UsbReceiveByte()

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

## Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

## Returns

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by UsbReceivePacket().

## 7.1401.2.9 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

## Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

## Returns

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

## 7.1401.2.10 UsbReceivePipeBulkOUT()

```
void UsbReceivePipeBulkOUT (
 blt_int8u epnum)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

## Returns

none.

## 7.1401.2.11 UsbTransmitByte()

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

**Parameters**

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

**Returns**

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

**7.1401.2.12 UsbTransmitPacket()**

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

**Parameters**

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

**Returns**

none.

**7.1401.2.13 UsbTransmitPipeBulkIN()**

```
void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

**Returns**

none.

## 7.1402.1 Detailed Description

Bootloader USB communication interface source file.

## 7.1402.2 Function Documentation

### 7.1402.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

**Parameters**

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

**Returns**

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by UsbInit().

**7.1402.2.2 UsbFifoMgrInit()**

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into fifoCtrl[]. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in fifoCtrl[] this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

**Returns**

none.

Referenced by UsbInit().

**7.1402.2.3 UsbFifoMgrRead()**

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

**Parameters**

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

**Returns**

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceiveByte(), and UsbTransmitPipeBulkIN().

#### 7.1402.2.4 UsbFifoMgrScan()

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

##### Parameters

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

##### Returns

Number of data entries in the fifo if successful, otherwise 0.

Referenced by UsbTransmitPipeBulkIN().

#### 7.1402.2.5 UsbFifoMgrWrite()

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

##### Parameters

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

##### Returns

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceivePipeBulkOUT(), and UsbTransmitByte().

#### 7.1402.2.6 UsbFree()

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

### 7.1402.2.7 UsbInit()

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

#### Returns

none.

### 7.1402.2.8 UsbReceiveByte()

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

#### Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

#### Returns

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by UsbReceivePacket().

### 7.1402.2.9 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

#### Returns

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

#### 7.1402.2.10 UsbReceivePipeBulkOUT()

```
void UsbReceivePipeBulkOUT (
 blt_int8u epnum)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

##### Returns

none.

#### 7.1402.2.11 UsbTransmitByte()

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

##### Parameters

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

##### Returns

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

#### 7.1402.2.12 UsbTransmitPacket()

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

##### Parameters

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

##### Returns

none.

### 7.1402.2.13 UsbTransmitPipeBulkIN()

```
void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

#### Returns

none.

### 7.1403.1 Detailed Description

Bootloader USB communication interface source file.

## 7.1403.2 Function Documentation

### 7.1403.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

#### Parameters

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

#### Returns

Fifo handle if successful, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by UsbInit().

### 7.1403.2.2 UsbFifoMgrInit()

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into fifoCtrl[]. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in fifoCtrl[] this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

#### Returns

none.

Referenced by UsbInit().

### 7.1403.2.3 UsbFifoMgrRead()

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

**Parameters**

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

**Returns**

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceiveByte(), and UsbTransmitPipeBulkIN().

**7.1403.2.4 UsbFifoMgrScan()**

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

**Parameters**

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

**Returns**

Number of data entries in the fifo if successful, otherwise 0.

Referenced by UsbTransmitPipeBulkIN().

**7.1403.2.5 UsbFifoMgrWrite()**

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

**Parameters**

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

**Returns**

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by `UsbReceivePipeBulkOUT()`, and `UsbTransmitByte()`.

#### 7.1403.2.6 `UsbFree()`

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

#### 7.1403.2.7 `UsbInit()`

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

##### Returns

none.

#### 7.1403.2.8 `UsbReceiveByte()`

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

##### Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

##### Returns

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by `UsbReceivePacket()`.

#### 7.1403.2.9 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

##### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

##### Returns

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

#### 7.1403.2.10 UsbReceivePipeBulkOUT()

```
void UsbReceivePipeBulkOUT (
 blt_int8u epnum)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

##### Returns

none.

#### 7.1403.2.11 UsbTransmitByte()

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

##### Parameters

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

##### Returns

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

## 7.1403.2.12 UsbTransmitPacket()

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

## Parameters

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

## Returns

none.

## 7.1403.2.13 UsbTransmitPipeBulkIN()

```
void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

## Returns

none.

## 7.1404 usb.c File Reference

Bootloader USB communication interface source file.

*Fifo pipe used for the bulk out endpoint.*
- static `tBulkInstance * instanceHandle`  
*Holds a handle to the bulk device instance.*

### 7.1404.1 Detailed Description

Bootloader USB communication interface source file.

### 7.1404.2 Function Documentation

#### 7.1404.2.1 UsbBulkRxHandler()

```
uint32_t UsbBulkRxHandler (
 void * pvCBData,
 uint32_t ui32Event,
 uint32_t ui32MsgValue,
 void * pvMsgData)
```

Handles bulk driver notifications related to the receive channel (data from the USB host).

#### Parameters

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <i>pvCBData</i>     | is the client-supplied callback pointer for this channel. |
| <i>ui32Event</i>    | identifies the event we are being notified about.         |
| <i>ui32MsgValue</i> | is an event-specific value.                               |
| <i>pvMsgData</i>    | is an event-specific pointer.                             |

#### Returns

The return value is event-specific.

#### 7.1404.2.2 UsbBulkTxHandler()

```
uint32_t UsbBulkTxHandler (
 void * pvCBData,
```

```
uint32_t ui32Event,
uint32_t ui32MsgValue,
void * pvMsgData)
```

Handles bulk driver notifications related to the transmit channel (data to the USB host).

#### Parameters

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <i>pvCBData</i>     | is the client-supplied callback pointer for this channel. |
| <i>ui32Event</i>    | identifies the event we are being notified about.         |
| <i>ui32MsgValue</i> | is an event-specific value.                               |
| <i>pvMsgData</i>    | is an event-specific pointer.                             |

#### Returns

The return value is event-specific.

#### 7.1404.2.3 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

#### Parameters

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

#### Returns

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by UsbInit().

#### 7.1404.2.4 UsbFifoMgrInit()

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into `fifoCtrl[]`. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in `fifoCtrl[]` this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

**Returns**

none.

Referenced by UsbInit().

**7.1404.2.5 UsbFifoMgrRead()**

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

**Parameters**

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

**Returns**

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceiveByte(), and UsbTransmitPipeBulkIN().

**7.1404.2.6 UsbFifoMgrScan()**

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

**Parameters**

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

**Returns**

Number of data entries in the fifo if successful, otherwise 0.

Referenced by UsbTransmitPipeBulkIN().

#### 7.1404.2.7 UsbFifoMgrWrite()

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

##### Parameters

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

##### Returns

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceivePipeBulkOUT(), and UsbTransmitByte().

#### 7.1404.2.8 UsbFree()

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

#### 7.1404.2.9 UsbInit()

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

##### Returns

none.

#### 7.1404.2.10 UsbReceiveByte()

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

**Parameters**

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

**Returns**

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by UsbReceivePacket().

**7.1404.2.11 UsbReceivePacket()**

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

**Parameters**

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

**Returns**

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

**7.1404.2.12 UsbReceivePipeBulkOUT()**

```
static void UsbReceivePipeBulkOUT (
 blt_int8u * data,
 blt_int32u len) [static]
```

Stores data that was received on the Bulk OUT pipe in the fifo.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to buffer with the newly received data |
| <i>len</i>  | Number of received data bytes.                 |

**Returns**

none.

Referenced by `UsbBulkRxHandler()`.

#### 7.1404.2.13 `UsbTransmitByte()`

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

##### Parameters

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

##### Returns

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by `UsbTransmitPacket()`.

#### 7.1404.2.14 `UsbTransmitPacket()`

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

##### Parameters

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

##### Returns

none.

#### 7.1404.2.15 `UsbTransmitPipeBulkIN()`

```
static void UsbTransmitPipeBulkIN (
 void) [static]
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

### Returns

none.

Referenced by `UsbBulkTxHandler()`, and `UsbTransmitPacket()`.

## 7.1405 usb.c File Reference

Bootloader USB communication interface source file.

```
#include "boot.h"
#include "usb.h"

### 7.1405.1 Detailed Description

Bootloader USB communication interface source file.

## 7.1405.2 Function Documentation

### 7.1405.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

#### Parameters

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

#### Returns

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by UsbInit().

### 7.1405.2.2 UsbFifoMgrInit()

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into fifoCtrl[]. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in fifoCtrl[] this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

#### Returns

none.

Referenced by UsbInit().

### 7.1405.2.3 UsbFifoMgrRead()

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

**Parameters**

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

**Returns**

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceiveByte(), and UsbTransmitPipeBulkIN().

**7.1405.2.4 UsbFifoMgrScan()**

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

**Parameters**

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

**Returns**

Number of data entries in the fifo if successful, otherwise 0.

Referenced by UsbTransmitPipeBulkIN().

**7.1405.2.5 UsbFifoMgrWrite()**

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

**Parameters**

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

**Returns**

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by `UsbReceivePipeBulkOUT()`, and `UsbTransmitByte()`.

#### 7.1405.2.6 `UsbFree()`

```
void UsbFree (
 void)
```

Releases the USB communication interface.

##### Returns

none.

#### 7.1405.2.7 `UsbInit()`

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

##### Returns

none.

#### 7.1405.2.8 `UsbReceiveByte()`

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

##### Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

##### Returns

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by `UsbReceivePacket()`.

### 7.1405.2.9 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

#### Returns

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

### 7.1405.2.10 UsbReceivePipeBulkOUT()

```
void UsbReceivePipeBulkOUT (
 blt_int8u epnum)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

#### Returns

none.

### 7.1405.2.11 UsbTransmitByte()

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

#### Parameters

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

#### Returns

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

### 7.1405.2.12 UsbTransmitPacket()

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

#### Parameters

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

#### Returns

none.

### 7.1405.2.13 UsbTransmitPipeBulkIN()

```
void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

#### Returns

none.

### 7.1406.1 Detailed Description

Bootloader USB communication interface source file.

### 7.1406.2 Function Documentation

#### 7.1406.2.1 UsbFifoMgrCreate()

```
static blt_int8u UsbFifoMgrCreate (
 blt_int8u * buffer,
 blt_int8u length) [static]
```

Places a data storage array under fifo management control. A handle for identifying the fifo in subsequent fifo management function calls is returned, if successful.

#### Parameters

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| <i>buffer</i> | Pointer to the first element in the data storage fifo.          |
| <i>length</i> | Maximum number of data elements that can be stored in the fifo. |

#### Returns

Fifo handle if successfull, or FIFO\_ERR\_INVALID\_HANDLE.

Referenced by `UsbInit()`.

#### 7.1406.2.2 UsbFifoMgrInit()

```
static void UsbFifoMgrInit (
 void) [static]
```

Initializes the fifo manager. Each controlled fifo is assigned a unique handle, which is the same as its index into `fifoCtrl[]`. Each controlled fifo holds a pointer to the next free fifo control. For the last fifo in `fifoCtrl[]` this one is set to a null-pointer as an out of fifo control indicator. Function should be called once before any of the other fifo management functions are called.

#### Returns

none.

Referenced by `UsbInit()`.

#### 7.1406.2.3 UsbFifoMgrRead()

```
static blt_bool UsbFifoMgrRead (
 blt_int8u handle,
 blt_int8u * data) [static]
```

Retrieves data from the fifo.

#### Parameters

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>handle</i> | Identifies the fifo to read data from.          |
| <i>data</i>   | Pointer to where the read data is to be stored. |

#### Returns

BLT\_TRUE if the data was successfully read from the fifo, BLT\_FALSE otherwise.

Referenced by `UsbReceiveByte()`, and `UsbTransmitPipeBulkIN()`.

#### 7.1406.2.4 UsbFifoMgrScan()

```
static blt_int8u UsbFifoMgrScan (
 blt_int8u handle) [static]
```

Returns the number of data entries currently present in the fifo.

#### Parameters

|               |                                            |
|---------------|--------------------------------------------|
| <i>handle</i> | Identifies the fifo that is to be scanned. |
|---------------|--------------------------------------------|

#### Returns

Number of data entries in the fifo if successful, otherwise 0.

Referenced by `UsbTransmitPipeBulkIN()`.

### 7.1406.2.5 UsbFifoMgrWrite()

```
static blt_bool UsbFifoMgrWrite (
 blt_int8u handle,
 blt_int8u data) [static]
```

Stores data in the fifo.

#### Parameters

|               |                                                        |
|---------------|--------------------------------------------------------|
| <i>handle</i> | Identifies the fifo to write data to.                  |
| <i>data</i>   | Pointer to the data that is to be written to the fifo. |

#### Returns

BLT\_TRUE if the data was successfully stored in the fifo, BLT\_FALSE otherwise.

Referenced by UsbReceivePipeBulkOUT(), and UsbTransmitByte().

### 7.1406.2.6 UsbFree()

```
void UsbFree (
 void)
```

Releases the USB communication interface.

#### Returns

none.

### 7.1406.2.7 UsbInit()

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

#### Returns

none.

### 7.1406.2.8 UsbReceiveByte()

```
static blt_bool UsbReceiveByte (
 blt_int8u * data) [static]
```

Receives a communication interface byte if one is present.

**Parameters**

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>data</i> | Pointer to byte where the data is to be stored. |
|-------------|-------------------------------------------------|

**Returns**

BLT\_TRUE if a byte was received, BLT\_FALSE otherwise.

Referenced by UsbReceivePacket().

**7.1406.2.9 UsbReceivePacket()**

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

**Parameters**

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

**Returns**

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

**7.1406.2.10 UsbReceivePipeBulkOUT()**

```
void UsbReceivePipeBulkOUT (
 blt_int8u epnum)
```

Stores data that was received on the Bulk OUT pipe in the fifo.

**Returns**

none.

**7.1406.2.11 UsbTransmitByte()**

```
static blt_bool UsbTransmitByte (
 blt_int8u data) [static]
```

Transmits a communication interface byte.

**Parameters**

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Value of byte that is to be transmitted. |
|-------------|------------------------------------------|

**Returns**

BLT\_TRUE if the byte was transmitted, BLT\_FALSE otherwise.

Referenced by UsbTransmitPacket().

**7.1406.2.12 UsbTransmitPacket()**

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

**Parameters**

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

**Returns**

none.

**7.1406.2.13 UsbTransmitPipeBulkIN()**

```
void UsbTransmitPipeBulkIN (
 void)
```

Checks if there is still data left to transmit and if so submits it for transmission with the USB endpoint.

**Returns**

none.

## 7.1407 usb.h File Reference

Bootloader USB communication interface header file.

This graph shows which files directly or indirectly include this file:

### Functions

- void **UsbInit** (void)  
*Initializes the USB communication interface.*
- void **UsbFree** (void)  
*Releases the USB communication interface.*
- void **UsbTransmitPacket** (blt\_int8u \*data, blt\_int8u len)  
*Transmits a packet formatted for the communication interface.*
- blt\_bool **UsbReceivePacket** (blt\_int8u \*data, blt\_int8u \*len)  
*Receives a communication interface packet if one is present.*
- void **UsbEnterLowPowerModeHook** (void)  
*Callback that gets called whenever the USB host requests the device to enter a low power mode.*
- void **UsbLeaveLowPowerModeHook** (void)  
*Callback that gets called whenever the USB host requests the device to exit low power mode.*
- void **UsbConnectHook** (blt\_bool connect)  
*Callback that gets called whenever the USB device should be connected to the USB bus.*

### 7.1407.1 Detailed Description

Bootloader USB communication interface header file.

### 7.1407.2 Function Documentation

#### 7.1407.2.1 UsbConnectHook()

```
void UsbConnectHook (
 blt_bool connect)
```

Callback that gets called whenever the USB device should be connected to the USB bus.

**Parameters**

|                |                                                  |
|----------------|--------------------------------------------------|
| <i>connect</i> | BLT_TRUE to connect and BLT_FALSE to disconnect. |
|----------------|--------------------------------------------------|

**Returns**

none.

Referenced by `UsbFree()`, and `UsbInit()`.

**7.1407.2.2 UsbEnterLowPowerModeHook()**

```
void UsbEnterLowPowerModeHook (
 void)
```

Callback that gets called whenever the USB host requests the device to enter a low power mode.

**Returns**

none.

Referenced by `UsbBulkRxHandler()`.

**7.1407.2.3 UsbFree()**

```
void UsbFree (
 void)
```

Releases the USB communication interface.

**Returns**

none.

Referenced by `ComFree()`.

**7.1407.2.4 UsbInit()**

```
void UsbInit (
 void)
```

Initializes the USB communication interface.

**Returns**

none.

Referenced by `ComInit()`.

### 7.1407.2.5 UsbLeaveLowPowerModeHook()

```
void UsbLeaveLowPowerModeHook (
 void)
```

Callback that gets called whenever the USB host requests the device to exit low power mode.

#### Returns

none.

Referenced by UsbBulkRxHandler().

### 7.1407.2.6 UsbReceivePacket()

```
blt_bool UsbReceivePacket (
 blt_int8u * data,
 blt_int8u * len)
```

Receives a communication interface packet if one is present.

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>data</i> | Pointer to byte array where the data is to be stored.   |
| <i>len</i>  | Pointer where the length of the packet is to be stored. |

#### Returns

BLT\_TRUE if a packet was received, BLT\_FALSE otherwise.

Referenced by ComTask().

### 7.1407.2.7 UsbTransmitPacket()

```
void UsbTransmitPacket (
 blt_int8u * data,
 blt_int8u len)
```

Transmits a packet formatted for the communication interface.

#### Parameters

|             |                                                            |
|-------------|------------------------------------------------------------|
| <i>data</i> | Pointer to byte array with data that it to be transmitted. |
| <i>len</i>  | Number of bytes that are to be transmitted.                |

### Returns

none.

Referenced by ComTransmitPacket().

## 7.1408 vectors.c File Reference

## Variables

- const [tIsrFunc \\_vectab](#) []

*The interrupt vector table. It contains the reset vector and all other interrupts vectors are remapped to the user program vector table.*

## 7.1422.1 Detailed Description

Demo program interrupt vectors source file.

## 7.1422.2 Macro Definition Documentation

### 7.1422.2.1 VCT\_USER\_PROGRAM\_VECTOR\_TABLE\_STARTADDR

```
#define VCT_USER_PROGRAM_VECTOR_TABLE_STARTADDR (0xE780)
```

Start address of the user program's vector table.

#### Attention

This value must be updated if the memory reserved for the bootloader changes.

## 7.1422.3 Function Documentation

### 7.1422.3.1 Vector0\_handler()

```
void Vector0_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

#### 7.1422.3.2 Vector10\_handler()

```
void Vector10_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1422.3.3 Vector11\_handler()

```
void Vector11_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1422.3.4 Vector12\_handler()

```
void Vector12_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1422.3.5 Vector13\_handler()

```
void Vector13_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

### 7.1422.3.6 Vector14\_handler()

```
void Vector14_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

### 7.1422.3.7 Vector15\_handler()

```
void Vector15_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

### 7.1422.3.8 Vector16\_handler()

```
void Vector16_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

### 7.1422.3.9 Vector17\_handler()

```
void Vector17_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

#### 7.1422.3.10 Vector18\_handler()

```
void Vector18_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1422.3.11 Vector19\_handler()

```
void Vector19_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1422.3.12 Vector1\_handler()

```
void Vector1_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1422.3.13 Vector20\_handler()

```
void Vector20_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

**7.1422.3.14 Vector21\_handler()**

```
void Vector21_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.15 Vector22\_handler()**

```
void Vector22_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.16 Vector23\_handler()**

```
void Vector23_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.17 Vector24\_handler()**

```
void Vector24_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.18 Vector25\_handler()**

```
void Vector25_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.19 Vector26\_handler()**

```
void Vector26_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.20 Vector27\_handler()**

```
void Vector27_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.21 Vector28\_handler()**

```
void Vector28_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.22 Vector29\_handler()**

```
void Vector29_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.23 Vector2\_handler()**

```
void Vector2_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.24 Vector30\_handler()**

```
void Vector30_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.25 Vector31\_handler()**

```
void Vector31_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.26 Vector32\_handler()**

```
void Vector32_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.27 Vector33\_handler()**

```
void Vector33_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.28 Vector34\_handler()**

```
void Vector34_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.29 Vector35\_handler()**

```
void Vector35_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.30 Vector36\_handler()**

```
void Vector36_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.31 Vector37\_handler()**

```
void Vector37_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.32 Vector38\_handler()**

```
void Vector38_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.33 Vector39\_handler()**

```
void Vector39_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.34 Vector3\_handler()**

```
void Vector3_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.35 Vector40\_handler()**

```
void Vector40_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.36 Vector41\_handler()**

```
void Vector41_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.37 Vector42\_handler()**

```
void Vector42_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.38 Vector43\_handler()**

```
void Vector43_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.39 Vector44\_handler()**

```
void Vector44_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.40 Vector45\_handler()**

```
void Vector45_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.41 Vector46\_handler()**

```
void Vector46_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.42 Vector47\_handler()**

```
void Vector47_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.43 Vector48\_handler()**

```
void Vector48_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.44 Vector49\_handler()**

```
void Vector49_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.45 Vector4\_handler()**

```
void Vector4_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.46 Vector50\_handler()**

```
void Vector50_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.47 Vector51\_handler()**

```
void Vector51_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.48 Vector52\_handler()**

```
void Vector52_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.49 Vector53\_handler()**

```
void Vector53_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.50 Vector54\_handler()**

```
void Vector54_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.51 Vector55\_handler()**

```
void Vector55_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.52 Vector56\_handler()**

```
void Vector56_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.53 Vector57\_handler()**

```
void Vector57_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.54 Vector58\_handler()**

```
void Vector58_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.55 Vector59\_handler()**

```
void Vector59_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.56 Vector5\_handler()**

```
void Vector5_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.57 Vector60\_handler()**

```
void Vector60_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.58 Vector61\_handler()**

```
void Vector61_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.59 Vector62\_handler()**

```
void Vector62_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.60 Vector6\_handler()**

```
void Vector6_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1422.3.61 Vector7\_handler()**

```
void Vector7_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

### 7.1422.3.62 Vector8\_handler()

```
void Vector8_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

### 7.1422.3.63 Vector9\_handler()

```
void Vector9_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

## 7.1423 vectors.c File Reference

Demo program interrupt vectors source file.

```
#include "header.h"
```

Include dependency graph for HCS12\_DevKit\_S12G128\_CodeWarrior/Prog/vectors.c:

#### Typedefs

- `typedef void(* near) (void)`  
*Type for vector table entries.*

## Variables

- const `tlsrFunc _vectab []`  
*Interrupt vector table.*

### 7.1423.1 Detailed Description

Demo program interrupt vectors source file.

### 7.1423.2 Variable Documentation

#### 7.1423.2.1 \_vectab

```
const tlsrFunc _vectab[]
```

Interrupt vector table.

Normally, these are at 0xff80-0xffff, but the bootloader occupies 0xe800 - 0xffff. The bootloader expects the vector table to be at the end of user program flash, which is 0xe780 - 0xe7ff. 2 more bytes are reserved for the checksum that is programmed and verified by the bootloader, so the start address ends up being 0xe77e. Note that this needs to be updated when the size of the bootloader changes, as defined in the `flashLayout[]` table in `flash.c` of the bootloader.

## 7.1424 vectors.c File Reference

Bootloader interrupt vector table source file.

```
#include "boot.h"
#include "hidef.h"
#include "start12.h"
```

Include dependency graph for HCS12\_Evbplus\_Dragon12p\_CodeWarrior/Boot/vectors.c:

## Variables

- const [tlsrFunc\\_vectab](#) []

*The interrupt vector table. It contains the reset vector and all other interrupts vectors are remapped to the user program vector table.*

### 7.1424.1 Detailed Description

Bootloader interrupt vector table source file.

### 7.1424.2 Macro Definition Documentation

#### 7.1424.2.1 VCT\_USER\_PROGRAM\_VECTOR\_TABLE\_STARTADDR

```
#define VCT_USER_PROGRAM_VECTOR_TABLE_STARTADDR (0xE780)
```

Start address of the user program's vector table.

#### Attention

This value must be updated if the memory reserved for the bootloader changes.

### 7.1424.3 Function Documentation

#### 7.1424.3.1 main()

```
void near main (
 void)
```

This is the entry point for the bootloader application and is called by the reset interrupt vector after the C-startup routines executed.

##### Returns

Program return code.  
none.  
Program exit code.  
None.

#### 7.1424.3.2 reset\_handler()

```
void reset_handler (
 void)
```

Wrapper for calling the default reset handler which puts the communication module in a disconnected state.

Reset interrupt service routine. Configures the stack, initializes RAM and jumps to function main.

##### Returns

none.

Referenced by `__attribute__()`, and `UnusedISR()`.

#### 7.1424.3.3 Vector0\_handler()

```
void Vector0_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.4 Vector10\_handler()

```
void Vector10_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.5 Vector11\_handler()

```
void Vector11_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.6 Vector12\_handler()

```
void Vector12_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.7 Vector13\_handler()

```
void Vector13_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.8 Vector14\_handler()

```
void Vector14_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.9 Vector15\_handler()

```
void Vector15_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.10 Vector16\_handler()

```
void Vector16_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

#### 7.1424.3.11 Vector17\_handler()

```
void Vector17_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

##### Returns

none.

**7.1424.3.12 Vector18\_handler()**

```
void Vector18_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.13 Vector19\_handler()**

```
void Vector19_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.14 Vector1\_handler()**

```
void Vector1_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.15 Vector20\_handler()**

```
void Vector20_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.16 Vector21\_handler()**

```
void Vector21_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.17 Vector22\_handler()**

```
void Vector22_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.18 Vector23\_handler()**

```
void Vector23_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.19 Vector24\_handler()**

```
void Vector24_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.20 Vector25\_handler()**

```
void Vector25_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.21 Vector26\_handler()**

```
void Vector26_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.22 Vector27\_handler()**

```
void Vector27_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.23 Vector28\_handler()**

```
void Vector28_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.24 Vector29\_handler()**

```
void Vector29_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.25 Vector2\_handler()**

```
void Vector2_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.26 Vector30\_handler()**

```
void Vector30_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.27 Vector31\_handler()**

```
void Vector31_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.28 Vector32\_handler()**

```
void Vector32_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.29 Vector33\_handler()**

```
void Vector33_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.30 Vector34\_handler()**

```
void Vector34_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.31 Vector35\_handler()**

```
void Vector35_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.32 Vector36\_handler()**

```
void Vector36_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.33 Vector37\_handler()**

```
void Vector37_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.34 Vector38\_handler()**

```
void Vector38_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.35 Vector39\_handler()**

```
void Vector39_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.36 Vector3\_handler()**

```
void Vector3_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.37 Vector40\_handler()**

```
void Vector40_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.38 Vector41\_handler()**

```
void Vector41_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.39 Vector42\_handler()**

```
void Vector42_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.40 Vector43\_handler()**

```
void Vector43_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.41 Vector44\_handler()**

```
void Vector44_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.42 Vector45\_handler()**

```
void Vector45_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.43 Vector46\_handler()**

```
void Vector46_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.44 Vector47\_handler()**

```
void Vector47_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.45 Vector48\_handler()**

```
void Vector48_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.46 Vector49\_handler()**

```
void Vector49_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.47 Vector4\_handler()**

```
void Vector4_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.48 Vector50\_handler()**

```
void Vector50_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.49 Vector51\_handler()**

```
void Vector51_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.50 Vector52\_handler()**

```
void Vector52_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.51 Vector53\_handler()**

```
void Vector53_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.52 Vector54\_handler()**

```
void Vector54_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.53 Vector55\_handler()**

```
void Vector55_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.54 Vector56\_handler()**

```
void Vector56_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.55 Vector57\_handler()**

```
void Vector57_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.56 Vector58\_handler()**

```
void Vector58_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.57 Vector59\_handler()**

```
void Vector59_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.58 Vector5\_handler()**

```
void Vector5_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.59 Vector60\_handler()**

```
void Vector60_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.60 Vector61\_handler()**

```
void Vector61_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.61 Vector62\_handler()**

```
void Vector62_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.62 Vector6\_handler()**

```
void Vector6_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

**7.1424.3.63 Vector7\_handler()**

```
void Vector7_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

**Returns**

none.

### 7.1424.3.64 Vector8\_handler()

```
void Vector8_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

### 7.1424.3.65 Vector9\_handler()

```
void Vector9_handler (
 void)
```

ISR handler for a specific vector index in the interrupt vector table for linking the actual interrupts vectors to the one in the user program's vector table.

#### Returns

none.

## 7.1425 vectors.c File Reference

Demo program interrupt vectors source file.

```
#include "header.h"
```

Include dependency graph for HCS12\_Evbplus\_Dragon12p\_CodeWarrior/Prog/vectors.c:

## Typedefs

- typedef void(\* [near](#)) (void)  
*Type for vector table entries.*

## Variables

- const [tIsrFunc \\_vectab](#) []  
*Interrupt vector table.*

### 7.1425.1 Detailed Description

Demo program interrupt vectors source file.

### 7.1425.2 Variable Documentation

#### 7.1425.2.1 \_vectab

```
const tIsrFunc _vectab[]
```

Interrupt vector table.

Normally, these are at 0xff80-0xffff, but the bootloader occupies 0xe800 - 0xffff. The bootloader expects the vector table to be at the end of user program flash, which is 0xe780 - 0xe7ff. 2 more bytes are reserved for the checksum that is programmed and verified by the bootloader, so the start address ends up being 0xe77e. Note that this needs to be updated when the size of the bootloader changes, as defined in the flashLayout[] table in flash.c of the bootloader.

## 7.1426 xcp.c File Reference

XCP 1.0 protocol core source file.

```
#include "boot.h"
```

Include dependency graph for xcp.c:

## Data Structures

- struct [tXcpInfo](#)  
*Structure type for grouping XCP internal module information.*

## Functions

- static void [XcpTransmitPacket](#) ([blt\\_int8u](#) \*data, [blt\\_int16s](#) len)  
*Transmits the packet using the xcp transport layer.*
- static [blt\\_int8u](#) [XcpComputeChecksum](#) ([blt\\_int32u](#) address, [blt\\_int32u](#) length, [blt\\_int32u](#) \*checksum)  
*Called by the BUILD\_CHECKSUM command to perform a checksum calculation over the specified memory region.*
- static [blt\\_int8u](#) [XcpGetSeed](#) ([blt\\_int8u](#) resource, [blt\\_int8u](#) \*seed)  
*Provides a seed to the XCP master that will be used for the key generation when the master attempts to unlock the specified resource. Called by the GET\_SEED command.*
- static [blt\\_int8u](#) [XcpVerifyKey](#) ([blt\\_int8u](#) resource, [blt\\_int8u](#) \*key, [blt\\_int8u](#) len)  
*Called by the UNLOCK command and checks if the key to unlock the specified resource was correct. If so, then the resource protection will be removed.*
- static void [XcpProtectResources](#) (void)  
*Utility function to protects all the available resources.*
- static void [XcpSetCtoError](#) ([blt\\_int8u](#) error)  
*Prepares the cto packet data for the specified error.*
- static void [XcpCmdConnect](#) ([blt\\_int8u](#) \*data)  
*XCP command processor function which handles the CONNECT command as defined by the protocol.*
- static void [XcpCmdDisconnect](#) ([blt\\_int8u](#) \*data)  
*XCP command processor function which handles the DISCONNECT command as defined by the protocol.*
- static void [XcpCmdGetStatus](#) ([blt\\_int8u](#) \*data)  
*XCP command processor function which handles the GET\_STATUS command as defined by the protocol.*

*XCP command processor function which handles the PROGRAM\_CLEAR command as defined by the protocol.*
- static void [XcpCmdProgramReset](#) ([blt\\_int8u](#) \*data)  
*XCP command processor function which handles the PROGRAM\_RESET command as defined by the protocol.*
- static void [XcpCmdProgramPrepare](#) ([blt\\_int8u](#) \*data)  
*XCP command processor function which handles the PROGRAM\_PREPARE command as defined by the protocol.*
- [blt\\_int8u](#) [XcpGetSeedHook](#) ([blt\\_int8u](#) resource, [blt\\_int8u](#) \*seed)

*Provides a seed to the XCP master that will be used for the key generation when the master attempts to unlock the specified resource. Called by the GET\_SEED command.*

- `blt_int8u XcpVerifyKeyHook (blt_int8u resource, blt_int8u *key, blt_int8u len)`

*Called by the UNLOCK command and checks if the key to unlock the specified resource was correct. If so, then the resource protection will be removed.*

- `void XcpInit (void)`

*Initializes the XCP driver. Should be called once upon system startup.*

- `blt_bool XcpsConnected (void)`

*Obtains information about the XCP connection state.*

- `void XcpPacketTransmitted (void)`

*Informs the core that a pending packet transmission was completed by the transport layer.*

- `void XcpPacketReceived (blt_int8u *data, blt_int8u len)`

*Informs the core that a new packet was received by the transport layer.*

## Variables

- `static const blt_int8s xcpStationId [] = XCP_STATION_ID_STRING`

*String buffer with station id.*

- `static tXcpInfo xcpInfo`

*Local variable for storing XCP internal module info.*

## 7.1426.1 Detailed Description

XCP 1.0 protocol core source file.

## 7.1426.2 Function Documentation

### 7.1426.2.1 XcpCmdBuildChecksum()

```
static void XcpCmdBuildChecksum (
 blt_int8u * data) [static]
```

XCP command processor function which handles the BUILD\_CHECKSUM command as defined by the protocol.

#### Parameters

|                   |                                                |
|-------------------|------------------------------------------------|
| <code>data</code> | Pointer to a byte buffer with the packet data. |
|-------------------|------------------------------------------------|

#### Returns

none

Referenced by `XcpPacketReceived()`.

#### 7.1426.2.2 XcpCmdConnect()

```
static void XcpCmdConnect (
 blt_int8u * data) [static]
```

XCP command processor function which handles the CONNECT command as defined by the protocol.

##### Parameters

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

##### Returns

none

Referenced by XcpPacketReceived().

#### 7.1426.2.3 XcpCmdDisconnect()

```
static void XcpCmdDisconnect (
 blt_int8u * data) [static]
```

XCP command processor function which handles the DISCONNECT command as defined by the protocol.

##### Parameters

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

##### Returns

none

Referenced by XcpPacketReceived().

#### 7.1426.2.4 XcpCmdGetId()

```
static void XcpCmdGetId (
 blt_int8u * data) [static]
```

XCP command processor function which handles the GET\_ID command as defined by the protocol.

##### Parameters

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.5 XcpCmdGetSeed()**

```
static void XcpCmdGetSeed (
 blt_int8u * data) [static]
```

XCP command processor function which handles the GET\_SEED command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.6 XcpCmdGetStatus()**

```
static void XcpCmdGetStatus (
 blt_int8u * data) [static]
```

XCP command processor function which handles the GET\_STATUS command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.7 XcpCmdProgram()**

```
static void XcpCmdProgram (
 blt_int8u * data) [static]
```

XCP command processor function which handles the PROGRAM command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.8 XcpCmdProgramClear()**

```
static void XcpCmdProgramClear (
 blt_int8u * data) [static]
```

XCP command processor function which handles the PROGRAM\_CLEAR command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.9 XcpCmdProgramMax()**

```
static void XcpCmdProgramMax (
 blt_int8u * data) [static]
```

XCP command processor function which handles the PROGRAM\_MAX command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

### 7.1426.2.10 XcpCmdProgramPrepare()

```
static void XcpCmdProgramPrepare (
 blt_int8u * data) [static]
```

XCP command processor function which handles the PROGRAM\_PREPARE command as defined by the protocol.

#### Parameters

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

#### Returns

none

Referenced by XcpPacketReceived().

### 7.1426.2.11 XcpCmdProgramReset()

```
static void XcpCmdProgramReset (
 blt_int8u * data) [static]
```

XCP command processor function which handles the PROGRAM\_RESET command as defined by the protocol.

#### Parameters

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

#### Returns

none

Referenced by XcpPacketReceived().

### 7.1426.2.12 XcpCmdProgramStart()

```
static void XcpCmdProgramStart (
 blt_int8u * data) [static]
```

XCP command processor function which handles the PROGRAM\_START command as defined by the protocol.

#### Parameters

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.13 XcpCmdSetMta()**

```
static void XcpCmdSetMta (
 blt_int8u * data) [static]
```

XCP command processor function which handles the SET\_MTA command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.14 XcpCmdShortUpload()**

```
static void XcpCmdShortUpload (
 blt_int8u * data) [static]
```

XCP command processor function which handles the SHORT\_UPLOAD command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.15 XcpCmdSynch()**

```
static void XcpCmdSynch (
 blt_int8u * data) [static]
```

XCP command processor function which handles the SYNCH command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.16 XcpCmdUnlock()**

```
static void XcpCmdUnlock (
 blt_int8u * data) [static]
```

XCP command processor function which handles the UNLOCK command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

**7.1426.2.17 XcpCmdUpload()**

```
static void XcpCmdUpload (
 blt_int8u * data) [static]
```

XCP command processor function which handles the UPLOAD command as defined by the protocol.

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>data</i> | Pointer to a byte buffer with the packet data. |
|-------------|------------------------------------------------|

**Returns**

none

Referenced by XcpPacketReceived().

### 7.1426.2.18 XcpComputeChecksum()

```
static blt_int8u XcpComputeChecksum (
 blt_int32u address,
 blt_int32u length,
 blt_int32u * checksum) [static]
```

Called by the BUILD\_CHECKSUM command to perform a checksum calculation over the specified memory region.

#### Parameters

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| <i>address</i>  | The start address of the memory region.                   |
| <i>length</i>   | Length of the memory region in bytes.                     |
| <i>checksum</i> | Pointer to where the calculated checksum is to be stored. |

#### Returns

Checksum type that was used during the checksum calculation.

Referenced by XcpCmdBuildCheckSum().

### 7.1426.2.19 XcpGetSeed()

```
static blt_int8u XcpGetSeed (
 blt_int8u resource,
 blt_int8u * seed) [static]
```

Provides a seed to the XCP master that will be used for the key generation when the master attempts to unlock the specified resource. Called by the GET\_SEED command.

#### Parameters

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <i>resource</i> | Resource that the seed is requested for (XCP_RES_XXX). |
| <i>seed</i>     | Pointer to byte buffer where the seed will be stored.  |

#### Returns

Length of the seed in bytes.

Referenced by XcpCmdGetSeed().

### 7.1426.2.20 XcpGetSeedHook()

```
blt_int8u XcpGetSeedHook (
 blt_int8u resource,
 blt_int8u * seed)
```

Provides a seed to the XCP master that will be used for the key generation when the master attempts to unlock the specified resource. Called by the GET\_SEED command.

**Parameters**

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <i>resource</i> | Resource that the seed is requested for (XCP_RES_XXX). |
| <i>seed</i>     | Pointer to byte buffer where the seed will be stored.  |

**Returns**

Length of the seed in bytes.

Referenced by XcpGetSeed().

**7.1426.2.21 XcpInit()**

```
void XcpInit (
 void)
```

Initializes the XCP driver. Should be called once upon system startup.

**Returns**

none

Referenced by ComInit().

**7.1426.2.22 XcpIsConnected()**

```
blt_bool XcpIsConnected (
 void)
```

Obtains information about the XCP connection state.

**Returns**

BLT\_TRUE is an XCP connection is established, BLT\_FALSE otherwise.

Referenced by ComIsConnected().

**7.1426.2.23 XcpPacketReceived()**

```
void XcpPacketReceived (
 blt_int8u * data,
 blt_int8u len)
```

Informs the core that a new packet was received by the transport layer.

**Parameters**

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Pointer to byte buffer with packet data. |
| <i>len</i>  | Number of bytes in the packet.           |

**Returns**

none

Referenced by ComTask(), and NetApp().

**7.1426.2.24 XcpPacketTransmitted()**

```
void XcpPacketTransmitted (
 void)
```

Informs the core that a pending packet transmission was completed by the transport layer.

**Returns**

none

Referenced by ComTransmitPacket().

**7.1426.2.25 XcpProtectResources()**

```
static void XcpProtectResources (
 void) [static]
```

Utility function to protects all the available resources.

**Returns**

none

Referenced by XcpCmdConnect(), XcpCmdDisconnect(), and XcpCmdUnlock().

**7.1426.2.26 XcpSetCtoError()**

```
static void XcpSetCtoError (
 blt_int8u error) [static]
```

Prepares the cto packet data for the specified error.

## Parameters

|              |                               |
|--------------|-------------------------------|
| <i>error</i> | XCP error code (XCP_ERR_XXX). |
|--------------|-------------------------------|

## Returns

none

Referenced by XcpCmdConnect(), XcpCmdGetSeed(), XcpCmdProgram(), XcpCmdProgramClear(), XcpCmdProgramMax(), XcpCmdProgramPrepare(), XcpCmdProgramReset(), XcpCmdProgramStart(), XcpCmdShortUpload(), XcpCmdSynch(), XcpCmdUnlock(), XcpCmdUpload(), and XcpPacketReceived().

## 7.1426.2.27 XcpTransmitPacket()

```
static void XcpTransmitPacket (
 blt_int8u * data,
 blt_int16s len) [static]
```

Transmits the packet using the xcp transport layer.

## Parameters

|             |                                                   |
|-------------|---------------------------------------------------|
| <i>data</i> | Pointer to the byte buffer with packet data.      |
| <i>len</i>  | Number of data bytes that need to be transmitted. |

## Returns

none

Referenced by XcpPacketReceived().

## 7.1426.2.28 XcpVerifyKey()

```
static blt_int8u XcpVerifyKey (
 blt_int8u resource,
 blt_int8u * key,
 blt_int8u len) [static]
```

Called by the UNLOCK command and checks if the key to unlock the specified resource was correct. If so, then the resource protection will be removed.

## Parameters

|                 |                                             |
|-----------------|---------------------------------------------|
| <i>resource</i> | resource to unlock (XCP_RES_XXX).           |
| <i>key</i>      | pointer to the byte buffer holding the key. |
| <i>len</i>      | length of the key in bytes.                 |

**Returns**

1 if the key was correct, 0 otherwise.

Referenced by XcpCmdUnlock().

**7.1426.2.29 XcpVerifyKeyHook()**

```
blt_int8u XcpVerifyKeyHook (
 blt_int8u resource,
 blt_int8u * key,
 blt_int8u len)
```

Called by the UNLOCK command and checks if the key to unlock the specified resource was correct. If so, then the resource protection will be removed.

**Parameters**

|                 |                                             |
|-----------------|---------------------------------------------|
| <i>resource</i> | resource to unlock (XCP_RES_XXX).           |
| <i>key</i>      | pointer to the byte buffer holding the key. |
| <i>len</i>      | length of the key in bytes.                 |

**Returns**

1 if the key was correct, 0 otherwise.

Referenced by XcpVerifyKey().

**7.1427 xcp.h File Reference**

XCP 1.0 protocol core header file.

This graph shows which files directly or indirectly include this file:

**Macros**

- `#define XCP_CTO_PACKET_LEN (ComGetActiveInterfaceMaxRxLen())`  
*Maximum length of the transport layer's command transmit object packet.*
- `#define XCP_DTO_PACKET_LEN (ComGetActiveInterfaceMaxTxLen())`  
*Maximum length of the transport layer's data transmit object packet.*
- `#define XCP_STATION_ID_STRING "OpenBLT"`  
*Name in string format that is used to identify the ECU to the XCP master using the GET\_ID command.*

- #define [XCP\\_MOTOROLA\\_FORMAT](#) (0x00)  
*XCP byte ordering according to the Intel (little-endian).*
- #define [XCP\\_RES\\_CALIBRATION\\_EN](#) (0)  
*Enable (=1) or disable (=0) support for the calibration resource. This is required when data is written to RAM during the XCP session.*
- #define [XCP\\_RES\\_PAGING\\_EN](#) (0)  
*Enable (=1) or disable (=0) support for the paging resource. This is required when switching between application specific calibration pages should be supported. In this case the application specific external functions AppCalSet↔Page and AppCalGetPage must be provided.*
- #define [XCP\\_RES\\_PROGRAMMING\\_EN](#) (1)  
*Enable (=1) or disable (=0) support for the programming resource. This is required when non-volatile memory will be erased or programmed during an XCP session. In this case the following external hardware specific functions must be provided: NvmWrite, NvmErase and CpuStartUserProgram.*
- #define [XCP\\_RES\\_DATA\\_ACQUISITION\\_EN](#) (0)  
*Enable (=1) or disable (=0) support for the data acquisition resource. This note that this feature is currently not supported by the XCP driver.*
- #define [XCP\\_RES\\_DATA\\_STIMULATION\\_EN](#) (0)  
*Enable (=1) or disable (=0) support for the data stimulation resource. This note that this feature is currently not supported by the XCP driver.*
- #define [XCP\\_SEED\\_KEY\\_PROTECTION\\_EN](#) (1)  
*Enable (=1) or disable (=0) support for the seed/key protection feature. If enabled, the XCP master has to perform a GET\_SEED/UNLOCK sequence to obtain access to a resource. The protection algorithm is implemented in Xcp↔GetSeed and XcpVerifyKey.*
- #define [XCP\\_UPLOAD\\_EN](#) (0)  
*Enable (=1) or disable (=0) uploading. By default, XCP always allows memory read operations using the commands UPLOAD and SHORT\_UPLOAD. This is not always desired for security reasons. If disabled, memory reads via XCP always return zero values.*
- #define [XCP\\_PACKET\\_RECEIVED\\_HOOK\\_EN](#) (0)  
*Enable (=1) or disable the hook function that gets called each time an XCP packet was received from the host.*
- #define [XCP\\_VERSION\\_PROTOCOL\\_LAYER](#) (0x0100)  
*XCP protocol layer version number (16-bit).*
- #define [XCP\\_VERSION\\_TRANSPORT\\_LAYER](#) (0x0100)  
*XCP transport layer version number (16-bit).*
- #define [XCP\\_PID\\_RES](#) (0xff)  
*Command response packet identifier.*
- #define [XCP\\_PID\\_ERR](#) (0xfe)  
*Error packet identifier.*
- #define [XCP\\_ERR\\_CMD\\_SYNCH](#) (0x00)  
*Cmd processor synchronization error code.*
- #define [XCP\\_ERR\\_CMD\\_BUSY](#) (0x10)  
*Command was not executed error code.*
- #define [XCP\\_ERR\\_CMD\\_UNKNOWN](#) (0x20)  
*Unknown or unsupported command error code.*
- #define [XCP\\_ERR\\_OUT\\_OF\\_RANGE](#) (0x22)  
*Parameter out of range error code.*
- #define [XCP\\_ERR\\_ACCESS\\_LOCKED](#) (0x25)  
*Protected error code. Seed/key required.*
- #define [XCP\\_ERR\\_PAGE\\_NOT\\_VALID](#) (0x26)  
*Cal page not valid error code.*
- #define [XCP\\_ERR\\_SEQUENCE](#) (0x29)  
*Sequence error code.*
- #define [XCP\\_ERR\\_GENERIC](#) (0x31)  
*Generic error code.*

- #define [XCP\\_CMD\\_CONNECT](#) (0xff)  
*CONNECT command code.*
- #define [XCP\\_CMD\\_DISCONNECT](#) (0xfe)  
*DISCONNECT command code.*
- #define [XCP\\_CMD\\_GET\\_STATUS](#) (0xfd)  
*GET\_STATUS command code.*
- #define [XCP\\_CMD\\_SYNCH](#) (0xfc)  
*SYNCH command code.*
- #define [XCP\\_CMD\\_GET\\_ID](#) (0xfa)  
*GET\_ID command code.*

- Maximum number of bytes of a key for the seed/key security feature.*

## Functions

- void `XcpInit` (void)

*Initializes the XCP driver. Should be called once upon system startup.*
- `blt_bool XcplsConnected` (void)

*Obtains information about the XCP connection state.*
- void `XcpPacketTransmitted` (void)

*Informs the core that a pending packet transmission was completed by the transport layer.*
- void `XcpPacketReceived` (`blt_int8u *data`, `blt_int8u len`)

*Informs the core that a new packet was received by the transport layer.*

### 7.1427.1 Detailed Description

XCP 1.0 protocol core header file.

### 7.1427.2 Macro Definition Documentation

### 7.1427.2.1 XCP\_PACKET\_RECEIVED\_HOOK\_EN

```
#define XCP_PACKET_RECEIVED_HOOK_EN (0)
```

Enable (=1) or disable the hook function that gets called each time an XCP packet was received from the host.

A master-slave bootloader can be realized by using this hook-function. The mode parameter in the XCP Connect command can be interpreted as a node ID. When trying to connect to a slave, a gateway could be activated that passes the packet on to the slave. When the response packet is received from the slave, [ComTransmitPacket\(\)](#) can be called to pass the response on to the host. At the end of a firmware update procedure, the XCP Program Reset command is called, which can be used to deactivate the gateway. If this hook-function returns BLT\_TRUE, the packet is no longer processed by the XCP module. If it returns BLT\_FALSE, then the packet is processed as usual by the XCP module.

## 7.1427.3 Function Documentation

### 7.1427.3.1 XcpInit()

```
void XcpInit (
 void)
```

Initializes the XCP driver. Should be called once upon system startup.

#### Returns

none

Referenced by ComInit().

### 7.1427.3.2 XcpIsConnected()

```
blt_bool XcpIsConnected (
 void)
```

Obtains information about the XCP connection state.

#### Returns

BLT\_TRUE is an XCP connection is established, BLT\_FALSE otherwise.

Referenced by ComIsConnected().

### 7.1427.3.3 XcpPacketReceived()

```
void XcpPacketReceived (
 blt_int8u * data,
 blt_int8u len)
```

Informs the core that a new packet was received by the transport layer.

**Parameters**

|             |                                          |
|-------------|------------------------------------------|
| <i>data</i> | Pointer to byte buffer with packet data. |
| <i>len</i>  | Number of bytes in the packet.           |

**Returns**

none

Referenced by ComTask(), and NetApp().

**7.1427.3.4 XcpPacketTransmitted()**

```
void XcpPacketTransmitted (
 void)
```

Informs the core that a pending packet transmission was completed by the transport layer.

**Returns**

none

Referenced by ComTransmitPacket().
